USAID
FROM THE AMERICAN PEOPLE

The 2022 Bangladesh Demographic and Health Survey (2022 BDHS) was conducted under the authority of the National Institute of Population Research and Training (NIPORT), Medical Education and Family Welfare Division, Ministry of Health and Family Welfare (MOHFW). The survey was implemented by Mitra and Associates, a private research agency, from June 2022 to December 2022. The funding for the 2022 BDHS was provided by the Government of Bangladesh (GOB) and the United States Agency for International Development (USAID). ICF provided technical assistance through The DHS Program, a USAID-funded project providing support and technical assistance in the implementation of population and health surveys in countries worldwide.

Additional information about the 2022 BDHS may be obtained from the National Institute of Population Research and Training (NIPORT), 13/1 Sheikh Shaheb Bazar Road, Azimpur, Dhaka-1205, Bangladesh (telephone: 88-02-2266-83612; internet: www.niport.gov.bd).

Information about The DHS Program may be obtained from ICF, 530 Gaither Road, Suite 500, Rockville, MD 20850, USA; telephone: +1-301-407-6500; fax: +1-301-407-6501; email: info@DHSprogram.com; internet: www.DHSprogram.com.

The contents of this report are the sole responsibility of NIPORT and ICF and do not necessarily reflect the views of USAID, the United States Government, or other donor agencies.

Cover: The Warriors of Terracotta: The warriors are facing each other riding on chariots—from the terracotta works of Kantaji Temple. Erection of the temple started in the year 1704 and ended in 1752. Taken by Utpal Saha on November 22, 2009, at Kantaji Temple, Dinajpur, Bangladesh.

READING AND UNDERSTANDING TABLES FROM THE 2022 BANGLADESH DEMOGRAPHIC AND HEALTH SURVEY (BDHS)	xxix
SUSTAINABLE DEVELOPMENT GOAL INDICATORS.....	xxxvii
MAP OF BANGLADESH.....	xxxviii
1 INTRODUCTION AND SURVEY METHODOLOGY	1
1.1 Survey Objectives.....	1
1.2 Sample Design.....	2
1.3 Questionnaires	4
1.4 Anthropometry, Blood Pressure, and Blood Glucose Measurements.....	5
1.5 Training of Trainers and Pretest	6
1.6 Training of Field Staff	6
1.7 Fieldwork.....	7
1.8 Data Processing	7
1.9 Response Rates.....	7
2 HOUSING CHARACTERISTICS AND HOUSEHOLD POPULATION	9
2.1 Housing Characteristics.....	9
2.2 Household Wealth	10
2.2.1 Household Durable Goods	10
2.2.2 Wealth Index.....	10
2.3 Household Population and Composition	11
2.4 Birth Registration	12
2.5 Education	13
2.5.1 Educational Attainment	13
2.5.2 School Attendance	14
2.5.3 Participation Rate in Organized Learning among Children Age 5	15
2.6 Ownership of an NID Card.....	15
3 CHARACTERISTICS OF RESPONDENTS	25
3.1 Basic Characteristics of Survey Respondents.....	25
3.2 Education and Literacy	25
3.3 Mass Media Exposure and Internet Usage	27
3.4 Employment	29
3.5 Occupation.....	29
3.6 Health Insurance Coverage.....	30
3.7 Recent Migration	31
3.7.1 Type of Migration.....	31
3.7.2 Reason for Migration	31

4	MARRIAGE AND SEXUAL ACTIVITY	45
4.1	Marital Status.....	45
4.2	Age at First Marriage.....	46
4.3	Age at First Sexual Intercourse	47
4.4	Recent Sexual Activity	47
4.5	Spousal Separation	48
4.6	Perceptions Regarding Age at First Marriage.....	48
4.7	Continuation of Education and Work After Marriage	48
5	FERTILITY.....	59
5.1	Current Fertility	59
5.2	Children Ever Born and Living	61
5.3	Birth Intervals.....	61
5.4	Insusceptibility to Pregnancy.....	63
5.5	Arrival of Menopause	64
5.6	Age at First Birth	64
5.7	Teenage Pregnancy	64
5.8	Pregnancy Outcomes and Induced Abortion Rates	66
6	FERTILITY PREFERENCES.....	77
6.1	Desire for Another Child.....	77
6.2	Ideal Number of Children.....	79
6.3	Fertility Planning Status	79
6.4	Wanted Fertility Rates	81
6.5	Spousal Agreement Regarding Desired Number of Children.....	81
7	FAMILY PLANNING	89
7.1	Contraceptive Use	90
7.1.1	Timing of Female Sterilization	91
7.1.2	Use of Emergency Contraception	91
7.2	Source of Modern Contraceptive Methods.....	92
7.3	Discontinuation of Contraceptives	93
7.4	Demand for Family Planning	93
7.5	Decision Making about Family Planning and Opinion about Using Family Planning.....	95
7.6	Pressure to Become Pregnant	95
7.7	Future Use of Contraception.....	95
7.8	Exposure to Family Planning Messages	96
7.9	Contact with Fieldworkers.....	96
7.10	Postpartum Counseling and Family Planning	96
8	INFANT AND CHILD MORTALITY.....	115
8.1	Infant and Child Mortality	116
8.2	Perinatal Mortality	118
8.3	High-risk Fertility Behavior	119
9	MATERNAL AND NEWBORN HEALTH CARE.....	125
9.1	Antenatal Care Coverage and Content	126
9.1.1	Skilled Providers.....	126
9.1.2	Place of Antenatal Care	127
9.1.3	Timing and Number of Antenatal Care Visits	127
9.2	Components of Antenatal Care.....	128
9.3	Quality of Antenatal Care.....	129
9.4	Protection against Neonatal Tetanus	129

9.5	Delivery Services.....	130
9.5.1	Institutional Deliveries.....	130
9.5.2	Delivery by Cesarean Section	132
9.5.3	Skilled Assistance during Delivery	133
9.6	Postnatal Care.....	134
9.6.1	Postnatal Health Check for Mothers	134
9.6.2	Postnatal Health Check for Newborns	135
9.6.3	Postnatal Health Checks for Mothers and Newborns	136
9.7	Newborn Care.....	137
9.7.1	Care of the Umbilical Cord.....	137
9.7.2	Bathing the Newborn	137
9.7.3	Essential Newborn Care.....	138
9.8	Problems in Accessing Health Care	138
10	CHILD HEALTH.....	165
10.1	Child's Size and Birth Weight.....	165
10.2	Symptoms of Acute Respiratory Infection and Care-seeking Behavior	166
10.3	Fever and Care-seeking Behavior.....	166
10.4	Diarrheal Disease.....	167
10.4.1	Diarrhea and Care-seeking Behavior	167
10.4.2	Feeding Practices	168
10.4.3	Oral Rehydration Therapy, Zinc, Continued Feeding, and Other Treatments ...	169
10.5	Treatment of Childhood Illness	170
11	NUTRITION OF CHILDREN AND ADULTS	183
11.1	Nutritional Status of Children.....	183
11.1.1	Anthropometry Training and Data Collection	185
11.1.2	Levels of Child Malnutrition	185
11.2	Infant and Young Child Feeding Practices	186
11.2.1	Ever Breastfed, Early Initiation of Breastfeeding, and Exclusive Breastfeeding for the First 2 Days after Birth.....	187
11.2.2	Exclusive Breastfeeding and Mixed Milk Feeding	187
11.2.3	Continued Breastfeeding and Bottle Feeding	189
11.2.4	Introduction of Complementary Foods	189
11.2.5	Minimum Dietary Diversity, Minimum Meal Frequency, Minimum Milk Feeding Frequency, Minimum Acceptable Diet, and Egg and/or Flesh Food Consumption.....	190
11.2.6	Sweet Beverage Consumption, Unhealthy Food Consumption, and Zero Vegetable or Fruit Consumption among Children	192
11.3	Micronutrient Supplementation and Deworming among Children	193
11.4	Adults' Nutritional Status.....	194
11.4.1	Nutritional Status of Women	195
11.4.2	Nutritional Status of Men.....	196
11.5	Iron-containing Supplementation During Pregnancy	197
12	WOMEN'S EMPOWERMENT	215
12.1	Married Women's Employment	216
12.2	Control over Women's Earnings	216
12.3	Control over Men's Earnings	217
12.4	Women's Ownership of Assets	218
12.4.1	Ownership of a House or Land and Documentation of Ownership	218
12.4.2	Ownership and Use of Mobile Phones, Bank Accounts, and National Identification Cards.....	219

12.5	Participation in Decision Making	219
12.6	Attitudes toward Wife Beating	220
12.7	Women's Empowerment and Demographic and Health Outcomes	221
13	HOUSEHOLD WATER AND SANITATION	235
13.1	Drinking Water Sources, Availability, and Treatment	235
13.2	Sanitation.....	236
13.3	Handwashing	238
14	BLOOD PRESSURE AND DIABETES.....	245
14.1	Coverage of Testing for Blood Pressure and Blood Glucose Measurement.....	246
14.2	Hypertension.....	246
14.2.1	High Blood Pressure Measurement.....	247
14.2.2	Blood Pressure Status	247
14.2.3	Awareness of, Medication for, and Control of Hypertension	248

FOREWORD

The 2022 Bangladesh Demographic and Health Survey (2022 BDHS) is the ninth nationally representative DHS survey conducted in Bangladesh. It is designed to provide information to address the monitoring and evaluation needs of the Health, Population and Nutrition Sector Program (HPNSP). It also provides policymakers and managers involved in this program with the information they need to effectively plan and implement future interventions. The survey generates evidence on basic national indicators of social and health progress including fertility, fertility preferences, family planning, childhood mortality, maternal and child health, and nutritional status of mothers and children.

The 2022 BDHS provides a comprehensive look at levels of and differentials in fertility, family planning, maternal and child health, and nutrition. It presents estimates for important sociodemographic and health indicators to assess the major changes that have taken place since the previous BDHS surveys. The indicators from the 2022 BDHS show that socioeconomic conditions in Bangladesh continue to improve. The true measure of a country's health system is its success in reducing infant and childhood mortality. There was a noteworthy decline in childhood mortality rates between 2007 and 2022. During this period, under-5 mortality fell from 58 to 31 deaths per 1,000 live births, and neonatal mortality declined from 29 to 20 deaths per 1,000 live births. Facility deliveries increased remarkably from 19% in the 2 years preceding the 2007 BDHS to 65% in the 2 years preceding the 2022 BDHS. Equity in use of facilities for delivery care among the poorest and richest women has improved notably. Although facility deliveries have increased, a high proportion of births are conducted via cesarean section (C-section): 45% of live births in the 2 years preceding the 2022 BDHS were delivered via C-section, up from 8% in 2007. Contraceptive prevalence is 64% in 2022, up from 56% in 2007. The total fertility rate (TFR) declined from 2.7 children per woman in 2007 to 2.3 in 2022. The proportion of children who are stunted declined from 43% to 24% during that period; the proportion of children who are underweight also decreased from 41% to 22%.

The multitude of demographic and health data provided by the 2022 BDHS is crucial in monitoring and evaluating the performance of the 4th HPNSP as well as developing the 5th HPNSP. The survey provides estimates for 14 indicators of the results framework of the 4th HPNSP. In addition, the BDHS has always been a key information resource for national program monitoring. However, the need for further detailed analyses of the BDHS data remains. We expect that the 2022 survey data will support policymakers and program managers in monitoring and designing programs and strategies for improving health, family planning, and nutrition services in Bangladesh.

The successful completion of the 2022 BDHS was made possible by the contributions of a number of organizations and individuals. I would like to thank the Director General of NIPORT and his research team for successfully completing the survey. I also thank ICF, icddr,b, and Mitra and Associates for their efforts in conducting the 2022 BDHS. I deeply appreciate the Government of Bangladesh and the United States Agency for International Development (USAID), Dhaka for providing financial assistance that helped to ensure the ultimate success of this important undertaking.

Md. Azizur Rahman

Director General
National Institute of Population Research and Training
Medical Education and Family Welfare Division
Ministry of Health and Family Welfare

PREFACE

The 2022 Bangladesh Demographic and Health Survey (2022 BDHS) is the ninth survey of its kind conducted in Bangladesh. Commenced in 1993, the series of BDHS surveys is the longest-running series of health care surveys in Bangladesh. The 2022 BDHS was implemented through a collaborative effort of the National Institute of Population Research and Training (NIPORT) and ICF. Financial support for the survey was provided by the Government of Bangladesh and the United States Agency for International Development (USAID), Bangladesh.

DHS surveys are conducted periodically in Bangladesh to serve as a source of population and health data for policymakers, program managers, and the research community. In general, the aims of the BDHS are to provide information to program managers and policymakers to meet the monitoring and evaluation needs of the Health, Population and Nutrition Sector Program (HPNSP). The wealth of demographic and health data will be instrumental in monitoring and designing programs and strategies for improving health, family planning, and nutrition services in the country.

The 2022 BDHS was steered by the members of the Stakeholder Advisory Committee (SAC), which consisted of experts from government, nongovernment, and international organizations as well as researchers and professionals working in the health, population, and nutrition sectors in Bangladesh. Their proficient knowledge and expert opinions during various phases of the survey implementation improved the quality of the survey tremendously. A Technical Working Group (TWG) was formed with representatives from NIPORT; the Ministry of Health and Family Welfare (MoHFW); Data for Impact (D4I); the University of Dhaka; USAID/Bangladesh; ICF; the International Center for Diarrhoeal Disease Research, Bangladesh (icddr,b); and Mitra and Associates. The TWG was responsible for assisting in the design of the survey instruments as well as the technical implementation of the survey. I would like to express my sincere appreciation to the SAC and TWG members for their sincere effort in all stages of the survey.

In addition, I extend sincere thanks to the Bangladesh Bureau of Statistics (BBS) for its support in selecting sample clusters and providing enumeration area maps, including field monitoring for the survey.

I would like to congratulate all of the professionals from the NIPORT Research Unit for the successful completion of the survey. I also extend my thanks to ICF, icddr,b, and Mitra and Associates for completing the task in a professional manner. Finally, the Government of Bangladesh and USAID deserve special thanks for providing financial support for the survey.

READING AND UNDERSTANDING TABLES FROM THE 2022 BANGLADESH DEMOGRAPHIC AND HEALTH SURVEY (BDHS)

The 2022 Bangladesh DHS final report is based on approximately 200 tables of data.

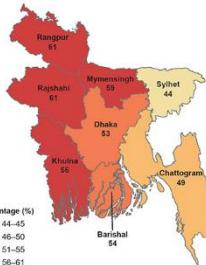

For quick reference, they are located at the end of each chapter and can be accessed through links in the pertinent text (electronic version). Additionally, this more reader-friendly version features about 90 figures that clearly highlight trends, subnational patterns, and background characteristics. Large, colorful maps display breakdowns for the eight administrative divisions in Bangladesh. The text has been simplified to highlight key points in bullets and to clearly identify indicator definitions in boxes.

While the text and figures featured in each chapter highlight some of the most important findings from the tables, not every finding can be discussed or displayed graphically. For this reason, BDHS data users should be comfortable reading and interpreting tables.

The following pages provide an introduction to the organization of BDHS tables and the presentation of background characteristics, along with a brief summary of sampling and understanding denominators. In addition, this section provides some exercises for users as they practice their new skills in interpreting BDHS tables.

- By division, modern method use is highest in Rajshahi and Rangpur (61% each) and lowest in Sylhet (44%) and Chittogram (49%) (Map 7.1). The 4th HNNSP aims to reach a modern contraceptive use prevalence of 60% in Chittogram and Sylhet by 2022 (Government of Bangladesh 2017).

Map 7.1 Modern contraceptive use by division
Percentage of currently married women age 15–49 using a modern contraceptive method

- In general, the use of modern contraceptive methods decreases with increasing wealth. Sixty-one percent of women in the lowest wealth quintile use a modern method, as compared with 48% of women in the highest quintile. The two most common methods—pills and injectables—follow this pattern also. However, condom use and the use of traditional methods increase as wealth increases. (Figure 7.3).

Figure 7.3 Use of modern methods by household wealth
Percentage of currently married women age 15–49 using a modern contraceptive method

7.1.1 Timing of Female Sterilization

Women who get sterilized generally undergo the procedure early in their reproductive years. About 32% of sterilized women had the procedure at age 30–34, 30% of women at age 25–29 and 18% of women before age 25. The median age at sterilization is 30 years (Table 7.2).

7.1.2 Use of Emergency Contraception

Emergency contraception has been used in the last 12 months by only 2% of ever-married women. Emergency contraception use is relatively high among younger women in the 15–19 and 20–24 age groups (3% each). Urban women use emergency contraception at a higher rate than rural women (2% vs. 1%). The usage of emergency contraception generally increases with increasing education. One percent of

Family Planning • 3

Example 1: Exposure to mass media

A Question Asked of All Survey Respondents

Table 3.4 Exposure to mass media 1

Percentage of ever-married women age 15–49 who are exposed to specific media on a weekly basis, according to background characteristics, Bangladesh DHS 2022

Background characteristic	3	Reads a newspaper at least once a week	Watches television at least once a week	Listens to the radio at least once a week	Accesses all three media at least once a week	Accesses none of the three media at least once a week	2	Number of women
Age								
15–19	1.1	45.4	1.5	0.1	53.9	2,576

Rangpur	2.4	45.1	1.0	0.2	54.1	3,452		
Sylhet	1.5	29.0	0.9	0.1	70.0	1,736		
Education								
No education	0.0	31.1	0.3	0.0	68.8	4,229		
Primary incomplete	0.3	39.5	0.5	0.0	60.2	3,926		
Primary complete	0.2	43.8	0.9	0.0	55.7	4,051		
Secondary incomplete	1.3	51.4	1.2	0.1	47.6	10,558		
Secondary complete or higher	8.0	60.6	2.1	0.6	37.3	7,314		
Wealth quintile								
Lowest	0.2	20.2	0.4	0.0	79.3	5,540		
Second	0.7	39.9	0.8	0.0	59.4	6,029		
Middle	1.3	51.2	1.2	0.1	47.9	6,167		
Fourth	2.4	58.2	1.4	0.2	40.7	6,204		
Highest	7.5	68.4	1.9	0.5	29.9	6,138		
Total	4	2.5	48.2	1.2	0.2	50.8	30,078	

Step 1: Read the title and subtitle, highlighted in orange in the table above. They tell you the topic and the specific population group being described. In this case, the table is about ever-married women age 15–49 and their exposure to different types of media. All eligible ever-married female respondents age 15–49 were asked these questions.

Step 2: Scan the column headings—highlighted in green in Example 1. They describe how the information is categorized. In this table, the first three columns of data show different types of media that women access at least once a week. The fourth column shows women who access all three types of media, while the fifth column shows women who do not access any of the three types of media on a weekly basis. The last column lists the number of women age 15–49 interviewed in the survey.

Step 3: Scan the row headings—the first vertical column highlighted in blue in Example 1. These show the different ways the data are divided into categories based on population characteristics. In this case, the table presents women’s exposure to media by age, urban-rural residence, division, level of education, and wealth quintile. Most of the tables in the BDHS report will be divided into these same categories.

Step 4: Look at the row at the bottom of the table highlighted in pink. These percentages represent the totals of all ever-married women age 15–49 and their weekly access to different types of media. In this

case, 2.5%* of ever-married women age 15–49 read a newspaper at least once a week, 48.2% watch television at least weekly, and 1.2% listen to the radio on a weekly basis.

Step 5: To find out what percentage of ever-married women in rural areas listen to the radio at least once a week, draw two imaginary lines, as shown on the table. This shows that 0.9% of ever-married women age 15–49 in rural areas listen to the radio at least once a week.

By looking at patterns by background characteristics, we can see how exposure to mass media varies across Bangladesh. Mass media are often used to communicate health messages. Knowing how mass media exposure varies among different groups can help program planners and policymakers determine how to most effectively reach their target populations.

*For the purpose of this document data are presented exactly as they appear in the table, including decimal places. However, the text in the remainder of this report rounds data to the nearest whole percentage point.

Practice: Use the table in Example 1 to answer the following questions:

- a) What percentage of ever-married women in Bangladesh do not access any of the three media at least once a week?
- b) Which age group of ever-married women is most likely to watch television at least once a week?
- c) Compare ever-married women by urban-rural residence—which group is more likely to read a newspaper at least once a week?
- d) What are the lowest and the highest percentages (range) of ever-married women who access none of the three media at least once a week by division?
- e) Is there a clear pattern in weekly exposure to newspapers by educational level?
- f) Is there a clear pattern in weekly exposure to television by wealth quintile?

f) Yes. By wealth quintile, the percentage of ever-married women who watch television at least once a week, compared with 68.4% of women in the highest wealth quintile.

e) Yes. By education level, the percentage of ever-married women with a secondary education or higher.

d) Access to none of the three media ranges from a low of 36.6% in Rajshahi to a high of 70.0% in Sylibet.

c) 5.2% of ever-married women in urban areas read a newspaper at least once a week, as compared with 1.4% of ever-married women in rural areas.

b) Ever-married women age 30–34: 52.6% of ever-married women in this age group watch television at least once a week.

a) 50.8%.

Answers:

Example 2: Children with symptoms of ARI and care seeking for symptoms of ARI

A Question Asked of a Subgroup of Survey Respondents

Table 10.2 Children with symptoms of ARI and care seeking for symptoms of ARI

1

Among children under age 5, percentage who had symptoms of acute respiratory infection (ARI) in the 2 weeks preceding the survey, and among children with symptoms of ARI in the 2 weeks preceding the survey, percentage for whom advice or treatment was sought, according to background characteristics, Bangladesh DHS 2022

Background characteristic	Among children under age 5:		Among children under age 5 with symptoms of ARI:		Number of children
	Percentage with symptoms of ARI ¹	Number of children	Percentage for whom advice or treatment was sought ²	Percentage for whom advice or treatment was sought the same or next day ²

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ Symptoms of ARI include short, rapid breathing that is chest-related and/or difficult breathing that is chest-related.

² Includes advice or treatment from the following sources: public sector, private medical sector, and nongovernmental organization (NGO) sector. Excludes advice or treatment from a traditional practitioner.

Step 1: Read the title and subtitle. In this case, the table is about two separate groups of children: all children under age 5 (a) and children under age 5 with symptoms of acute respiratory infection (ARI) in the 2 weeks before the survey (b).

Step 2: Identify the two panels. First, identify the columns that refer to all children under age 5 (a), and then isolate the columns that refer only to children under age 5 with symptoms of ARI in the 2 weeks before the survey (b).

Step 3: Look at the first panel. What percentage of children under age 5 had symptoms of ARI in the 2 weeks before the survey? It is 1.4%. Now look at the second panel. How many children under age 5 had symptoms of ARI in the 2 weeks before the survey? It's 120 children or 1.4% of the 8,573 children under age 5 (with rounding). The second panel is a subset of the first panel.

Step 4: Only 1.4% of children under age 5 had symptoms of ARI in the 2 weeks before the survey. Once these children are further divided into the background characteristic categories, there may be too few cases for the percentages to be reliable.

- What percentage of children under age 5 with symptoms of ARI in the 2 weeks before the survey in urban areas were taken for advice or treatment? 84.8%. This percentage is in parentheses because there are between 25 and 49 children (unweighted) in this category. Readers should use this number with caution—it may not be reliable. (For more information on weighted and unweighted numbers, see Example 3.)
- What percentage of children under age 5 with symptoms of ARI in the 2 weeks before the survey are from Barishal? There is no number in this cell—only an asterisk. This is because there are fewer than 25 unweighted cases. Results for this group are not reported. The subgroup is too small, and therefore the data are not reliable.

Note: When parentheses or asterisks are used in a table, the explanation will be noted under the table. If there are no parentheses or asterisks in a table, you can proceed with confidence that enough cases were included in all categories that the data are reliable.

Example 3: Understanding Sampling Weights in BDHS Tables

A sample is a group of people who have been selected for a survey. In the BDHS, the sample is designed to represent the national population of ever-married women age 15–49. In addition to national data, most countries want to collect and report data on smaller geographical or administrative areas. However, doing so requires a large enough sample size in each area. For the 2022 BDHS, the survey sample is representative at the national and division levels and for urban and rural areas.

To generate statistics that are representative of Bangladesh as a whole and the eight administrative divisions, the number of ever-married women surveyed in each division should contribute to the size of the total (national) sample in proportion to the size of the division. However, if some divisions have small populations, then a sample allocated in proportion to each division's population may not include sufficient ever-married women from each division for analysis. To solve this problem, divisions with small populations are oversampled. For example, let's say that you have enough money to interview 30,078 ever-married women and want to produce results that are representative of Bangladesh as a whole and its divisions (as in Table 3.1.1). However, the total population of Bangladesh is not evenly distributed among the divisions: some divisions, such as Dhaka, are heavily populated while others, such as Sylhet, are not. Thus, Sylhet must be oversampled.

A sampling statistician determines how many women should be interviewed in each district in order to get reliable statistics. The **blue column (1)** in the table above shows the actual number of women interviewed in each division. Within the divisions, the number of ever-married women interviewed ranges from 3,208 in Sylhet to 4,554 in Dhaka. The number of interviews is sufficient to get reliable results in each division.

With this distribution of interviews, some divisions are overrepresented and some divisions are underrepresented. For example, the population in Dhaka is 25.4% of the population in Bangladesh, while Sylhet's population contributes only 5.8% of the population in Bangladesh. But as the blue column shows, the number of women interviewed in Dhaka accounts for only 15.1% of the total sample of women interviewed ($4,554/30,078$) and the number of women interviewed in Sylhet accounts for 10.7% of the total sample of women interviewed ($3,208/30,078$). This unweighted distribution of women does not accurately represent the population.

In order to get statistics that are representative of Bangladesh, the distribution of the women in the sample needs to be weighted (or mathematically adjusted) such that it resembles the true distribution in Bangladesh. Women from a small division, like Sylhet, should contribute only a small amount to the national total. Women from a large division, like Dhaka, should contribute much more. Therefore, DHS statisticians mathematically calculate a “weight” that is used to adjust the number of women from each division so that each division's contribution to the total is proportional to the actual population of the division. The numbers in the **purple column (2)** represent the “weighted” values. The weighted values can be smaller or larger than the unweighted values at the district level. The total national sample size of 30,078 women has not changed after weighting, but the distribution of the women in the divisions has been changed to represent their contribution to the total population size.

How do statisticians weight each category? They take into account the probability that a woman was selected in the sample. If you were to compare the **green column (3)** to the actual population distribution of Bangladesh, you would see that ever-married women in each division are contributing to the total

Women			
Background characteristic	3 Weighted percent	2 Weighted number	1 Unweighted number
Division			
Barishal	6.1	1,825	3,232
Chattogram	18.6	5,585	4,461
Dhaka	25.4	7,637	4,554
Khulna	12.0	3,602	3,928
Mymensingh	7.7	2,305	3,255
Rajshahi	13.1	3,935	3,816
Rangpur	11.5	3,452	3,624
Sylhet	5.8	1,736	3,208
Total	100.0	30,078	30,078

sample with the same weight that they contribute to the population of the country. The weighted number of ever-married women in the survey now accurately represents the proportion of ever-married women who live in Dhaka and the proportion of ever-married women who live in Sylhet.

With sampling and weighting, it is possible to interview enough women to provide reliable statistics at national and division levels. In general, only the weighted numbers are shown in each of the BDHS tables, so don't be surprised if these numbers seem low: they may actually represent a larger number of ever-married women interviewed.

SUSTAINABLE DEVELOPMENT GOAL INDICATORS

Sustainable Development Goal Indicators, Bangladesh DHS 2022

Indicator		Residence		Total	DHS table number
		Urban	Rural		
		Sex			
		Male	Female	Total	DHS table number

¹ Percentage of the population with access to electricity from the national grid or solar

² Expressed in terms of deaths per 1,000 live births for the 5-year period preceding the survey

³ Data are available for currently married women age 15–49 only.

⁴ Equivalent to the age-specific fertility rate for girls age 10–14 for the 3-year period preceding the survey, expressed in terms of births per 1,000 girls age 10–14

⁵ Equivalent to the age-specific fertility rate for women age 15–19 for the 3-year period preceding the survey, expressed in terms of births per 1,000 women age 15–19

⁶ Data are available for ever-married women age 15–49 only.

⁷ Data are available for ever-married women age 15–49 who have used the internet in the past 12 months.

BANGLADESH

INTRODUCTION AND SURVEY METHODOLOGY

The 2022 Bangladesh Demographic and Health Survey (2022 BDHS) is the ninth national survey to report on the demographic and health status of the country's women and children. The main objective of the 2022 BDHS is to provide up-to-date information on fertility and fertility preferences; childhood mortality levels and causes of death; awareness, approval, and use of family planning methods; maternal and child health, including breastfeeding practices and nutritional status; newborn care; women's empowerment; selected noncommunicable diseases (NCDs); mental health; and availability and accessibility of health and family planning services at the community level. The information collected through the 2022 BDHS is intended to assist policymakers and program managers in designing and evaluating programs and strategies for improving the health of the population of Bangladesh. The survey also provides estimates for 15 major indicators relevant to the 4th Health, Population and Nutrition Sector Program (4th HPNSP) 2017–2022 of the Ministry of Health and Family Welfare (MoHFW 2017a) and to the Sustainable Development Goals (SDGs) for Bangladesh.

The 2022 BDHS was conducted under the authority of the National Institute of Population Research and Training (NIPORT), Medical Education and Family Welfare Division, Ministry of Health and Family Welfare, and the Government of Bangladesh. Financial assistance was provided jointly by the Government of Bangladesh and the United States Agency for International Development (USAID). Mitra and Associates, a Bangladeshi research firm in Dhaka, implemented the survey. ICF provided technical assistance through The Demographic and Health Surveys (DHS) Program, which is funded by USAID. The DHS Program offers financial support and technical assistance for population and health surveys in countries worldwide. The International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b) also provided technical assistance during the survey, especially on the Verbal Autopsy Questionnaires designed to determine the causes of deaths among children under age 5.

Members of the Stakeholder Advisory Committee (SAC), which included experts from government (including the MoHFW), nongovernmental, and international organizations as well as researchers and professionals who work in the health, nutrition, and population sectors, contributed their expert opinions and endorsement during survey implementation. In addition, a Technical Working Group (TWG) was formed with representatives from NIPORT, the Program Management and Monitoring Unit of the Ministry of Health and Family Welfare, ICF, icddr,b, the University of Dhaka, Data for Impact (D4I), Mitra and Associates, and USAID/Bangladesh. The TWG was in charge of the design of the survey instruments and the technical implementation of the survey. The Sampling Committee, with representatives from NIPORT, the Bangladesh Bureau of Statistics (BBS), ICF, the University of Dhaka, icddr,b, D4I, and Jagannath University, provided technical guidance in finalizing the sampling design.

1.1 SURVEY OBJECTIVES

The primary objective of the 2022 BDHS is to provide up-to-date estimates of basic demographic and health indicators. Specifically, the BDHS collected information on:

- Demographic rates, particularly fertility rates, and infant and child mortality rates at the national and divisional levels
- Direct and indirect factors that determine levels of and trends in fertility and infant and child mortality
- Contraceptive use among currently married women

- Maternal and child health, including antenatal care, assistance at delivery, postnatal care, newborn care, breastfeeding, and prevalence and treatment of acute respiratory infections (ARIs), diarrhea, and other diseases among children under age 5
- Empowerment of women
- Nutritional status of children under age 5, women, and men using anthropometric measurements (weight and height) and infant and child feeding practices
- Biomarkers such as blood pressure and blood glucose among women and men age 18 and older
- Causes of death among children under age 5
- Accessibility and availability of health and family planning services
- Coverage of services for mental health including symptoms of anxiety and depression
- Chronic diseases
- Newborn care and other care behaviors relevant to the Sustainable Development Goals (SDGs)

1.2 SAMPLE DESIGN

The sampling frame used for the 2022 BDHS is the Integrated Multi-Purpose Sampling Master Sample, selected from a complete list of enumeration areas (EAs) covering the whole country. It was prepared by the BBS for the 2011 population census of the People's Republic of Bangladesh. The sampling frame contains information on EA location, type of residence (city corporation, other than city corporation, or rural), and the estimated number of residential households. A sketch map that delineates geographic boundaries is available for each EA.

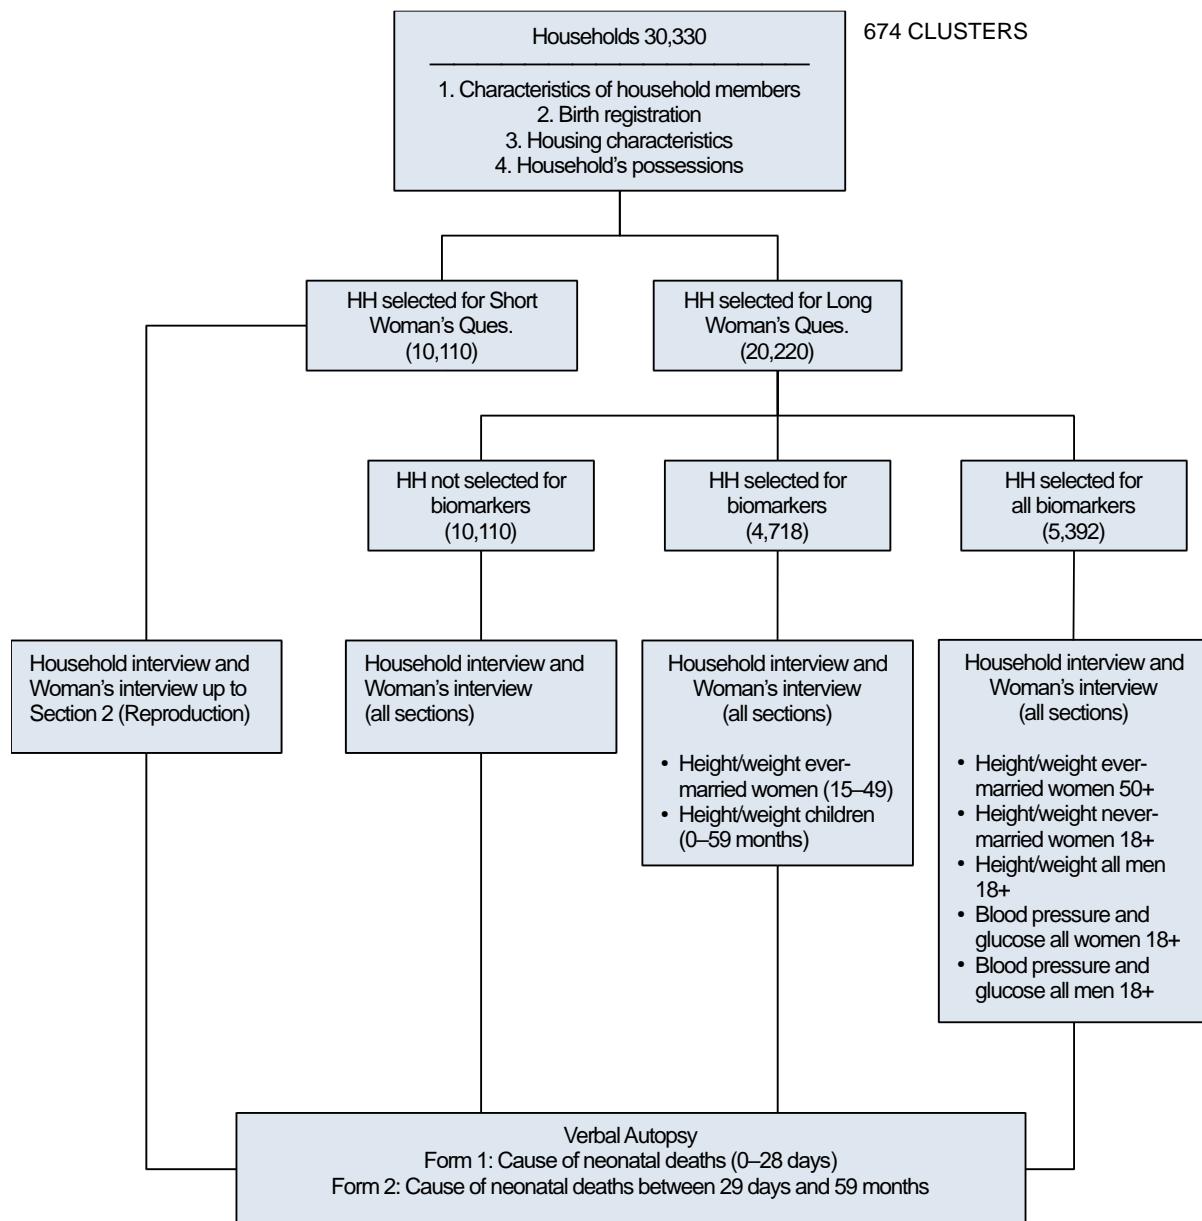

Bangladesh contains eight administrative divisions: Barishal, Chattogram, Dhaka, Khulna, Mymensingh, Rajshahi, Rangpur, and Sylhet. Each division is divided into zillas and each zila into upazilas. Each urban area in an upazila is divided into wards, which are further subdivided into mohallas. A rural area in an upazila is divided into union parishads (UPs) and, within UPs, into mouzas. These administrative divisions allow the country to be separated into rural and urban areas.

The survey is based on a two-stage stratified sample of households. In the first stage, 675 EAs (237 in urban areas and 438 in rural areas) were selected with probability proportional to EA size. The BBS drew the sample in the first stage following specifications provided by ICF. A complete household listing operation was then carried out by Mitra and Associates in all selected EAs to provide a sampling frame for the second-stage selection of households.

In the second stage of sampling, a systematic sample of 45 households per EA was selected to provide statistically reliable estimates of key demographic and health variables for urban and rural areas separately and for each of the eight divisions in Bangladesh. Ever-married women age 15–49 were considered eligible for individual interviews. Eligible women in each household were asked a set of core questions on background characteristics and reproductive history. Thirty of the 45 households in each EA were randomly selected for the long individual questionnaire administered to all eligible women within the household; in the remaining 15 households, a short version of the questionnaire was administered to all eligible women. Half of the households selected in the long questionnaire subsample (15 of 30 households) were systematically selected for biomarker measurements (also known as the biomarker subsample), specifically height and weight measurements among children under age 5 and ever-married women age 15–49. In addition, about half (8 of 15) of the households selected in the biomarker subsample were systematically selected for anthropometric measurements among ever-married women age 50 and above, never-married women age 18 and above, and all men age 18 and above, and blood pressure and blood

glucose measurements were taken for all women and men age 18 and above. **Figure 1.1** shows the household members eligible for the various biomarker samples.

Figure 1.1 2022 Bangladesh DHS sample design

The survey was successfully carried out in 674 clusters after the elimination of one rural cluster located in Cox's Bazar, Chittagong, due to security concerns. Based on this design, a total of 30,330 residential households were selected (19,665 from rural areas and 10,665 from urban areas). Thirty-one listing teams, each consisting of two listers/mappers, were deployed in the field to complete the listing operation. In addition, 12 quality control officers were deployed in the field. Overall, 74 listers/mappers were deployed in the field to complete the listing work. Training for the household listers/mappers took place April 24–29, 2022. The household listing operation was carried out in two phases (each about 4 weeks in duration) in all selected EAs from May 25 to July 27, 2022.

Any analysis using the 2022 BDHS data requires application of sampling weights to ensure the actual representation of the survey results at the national and division levels.

1.3 QUESTIONNAIRES

Four main types of questionnaires were used for the 2022 BDHS: the Household Questionnaire, the Woman’s Questionnaire (completed by ever-married women age 15–49), the Biomarker Questionnaire, and two Verbal Autopsy Questionnaires. The Household, Woman’s, and Biomarker Questionnaires, based on The DHS Program’s model questionnaires, were adapted to reflect population and health issues relevant to Bangladesh. In addition to these four core questionnaires, the 2022 BDHS also included a Fieldworker Questionnaire that gathered information about the survey fieldworkers and a remeasurement questionnaire that was administered to a subsample of children to remeasure their height and weight. The remeasurement was done as a quality control measure to validate the accuracy of the anthropometric measurements. The questionnaires were adapted for use in Bangladesh after a series of meetings with the TWG. The questionnaires were developed in English and then translated to and printed in Bangla.

For each cluster, Global Positioning System (GPS) data were collected during interviews using a GPS USB dongle. The protocol for the 2022 BDHS received clearance from both the ICF Institutional Review Board ethics committee and the Bangladesh Medical Research Council (BMRC).

Household Questionnaire: The Household Questionnaire listed all of the usual members of and visitors to the selected households. Basic information was collected on the characteristics of each person listed, including age, sex, education, current work status, birth registration, and individual possession of a mobile phone. A key objective of the Household Questionnaire was to identify women who were eligible for individual interviews and all individuals who were eligible for biomarker assessments. In addition, information was collected about the dwelling unit, such as the source of water, type of toilet facilities, materials used to construct the floor and walls, ownership of various consumer goods, and availability of handwashing facilities.

Woman’s Questionnaire: The Woman’s Questionnaire collected information from ever-married women age 15–49. Women answered questions on the following topics:

- Background characteristics (for example, age, education, religion, and media exposure)
- Reproductive history
- Use and source of family planning methods
- Antenatal, delivery, postnatal, and newborn care and breastfeeding
- Infant feeding practices and illness
- Marriage and sexual activity
- Fertility preferences
- Husbands’ background characteristics and women’s work
- Mental health and well-being

Ever-married women in two-thirds of selected households completed a long (full) questionnaire that included all of the topics mentioned above. Ever-married women in the other one-third of selected households were administered a short questionnaire and provided information only on background characteristics and reproductive history.

Biomarker Questionnaire: In addition to the data collected through interviews, biomarker data were collected in a subsample of households in the 2022 BDHS. The biomarkers collected included anthropometry (height and weight), blood pressure, and blood glucose measurements. ICF, along with local experts, assisted with the development of the biomarker testing protocol and arranged for the required approval by the ICF Institutional Review Board and the BMRC. The Biomarker Questionnaire was completed on paper during data collection and then entered in the computer-assisted personal interviewing (CAPI) system by interviewers before the team left the cluster.

Verbal Autopsy Questionnaires: Two questionnaires collected information related to causes of death among young children; the first questionnaire collected data on neonatal deaths (deaths at 0–28 days), and

the second collected data on deaths between 29 days and 59 months. Mothers who reported the death of a child under age 5 in the 5-year period prior to the 2022 BDHS answered verbal autopsy questions. Assistance with training of fieldworkers in implementing the Verbal Autopsy Questionnaires was provided by icddr,b.

Fieldworker Questionnaire: The Fieldworker Questionnaire collected basic background information on the people collecting data in the field, including quality control officers, team supervisors, interviewers, and biomarker technicians. The self-administered questionnaire served as a tool in conducting analyses of data quality. Each interviewer completed the questionnaire after the final selection of interviewers and before the fieldworkers entered the field. No personal identifiers were attached to the 2022 BDHS fieldworker data file.

1.4 ANTHROPOMETRY, BLOOD PRESSURE, AND BLOOD GLUCOSE MEASUREMENTS

In the 2022 BDHS, one-third of the 45 households in each cluster were selected for collection of anthropometric measurements for children age 0–59 months and ever-married women age 15 to 49. In addition, in half of the households selected for biomarker measurements (one-sixth of all households), all ever-married women age 50 and older, never-married women age 18 and older, and men age 18 and older were weighed and had their height measured. Blood pressure measurements and blood glucose testing were also conducted among all adult men and women age 18 and older in these households.

Anthropometry: Weight measurements were taken using SECA scales with a digital display (model number SECA 874U). Height and length were measured with a ShorrBoard® measuring board. Children younger than age 24 months were measured lying down (recumbent length), while older children and adults were measured standing (height).

For children, anthropometric data are used to calculate three indices that reflect nutritional status: height-for-age, weight-for-height, and weight-for-age. In presenting the anthropometric results, the height and weight of children in the survey population were compared with the 2006 WHO Child Growth Standards, which are based on an international sample of ethnically, culturally, and genetically diverse, healthy children living under optimum conditions conducive to achieving a child's full genetic growth potential (WHO 2006a). Children who were severely malnourished were referred to a local health facility for assessment and treatment. Biomarker technicians provided all households with an informational pamphlet containing the height and weight of all eligible children and adults.

Blood pressure: Biomarker specialists measured systolic and diastolic blood pressure with the Multi-User Upper Arm Blood Pressure Monitor UA-767F/FAC. Each team was equipped with three monitors having different cuff sizes: (1) UA-767F/FAC with medium cuff, (2) UA-767PVS with small cuff, and (3) UA-789AC with extra-large cuff. An additional cuff of each size was provided. Three blood pressure measurements were taken at intervals of 5 minutes or more. The average of the second and third measurements was used to classify hypertension results according to internationally recommended categories (WHO 1999). Blood pressure measurements in the 2022 Bangladesh DHS are used to provide a statistical description of the survey population. Measurements taken in the BDHS do not constitute a medical diagnosis of disease. Respondents found to have high blood pressure, identified as systolic pressure greater than 140 mmHg and/or diastolic pressure greater than 90 mmHg, received a referral to a local health facility. All households where biomarkers were collected were provided with an informational pamphlet on blood pressure.

Glucose testing: The HemoCue 201 RT analyzer was used for measurement of blood glucose. Capillary whole blood was obtained from the middle or ring finger after respondents had fasted overnight. The first two drops were wiped away, and the third drop was taken for measurement. The HemoCue 201 RT analyzer displayed the blood glucose measurements in milligrams per deciliter (mg/dL). This unit of measurement was converted into millimoles per liter (mmol/L) to maintain consistency with the units used

in past surveys. World Health Organization cutoff points were used for fasting plasma blood glucose measurements. Individuals with fasting plasma glucose values of 7.0 mmol/L and above were classified as having diabetes and received a referral to a local health facility.

1.5 TRAINING OF TRAINERS AND PRETEST

The training of trainers for the main BDHS survey was carried out simultaneously with the pretest training. Fourteen trainers (six from icddr,b and eight from Mitra and Associates) participated in the training of trainers. Three supervisors, 12 interviewers, and six biomarker technicians were trained for the pretest. Representatives of ICF attended the training as resource persons. The pretest training and pretest fieldwork took place from June 5 to June 25, 2022, in Dhaka. The questionnaires were pretested with 120 households in three rural clusters in Manikgonj District and three urban clusters in Dhaka. In these households, 131 women's interviews and two verbal autopsies were conducted. The purpose of the pretest was to check the data entry program, translation, consistency, integrity and flow of the questionnaires, and the efficacy of the biomarker measurement and testing procedures as well as to detect problems, if any, in the fieldwork procedures. Based on observations in the field and suggestions made by the pretest teams, revisions were made in the wording and translations of the questionnaires. CAPI was used in the pretesting.

1.6 TRAINING OF FIELD STAFF

Training for the 2022 BDHS fieldworkers was conducted from June 27 to July 30, 2022. Two training programs were organized, one on the Household Questionnaire and the Woman's Questionnaire for interviewers, team supervisors, and quality control officers and another on biomarker components for biomarker technicians. The trainees were split into four groups, each with about 40–50 trainees. A total of 178 field staff (46 men and 132 women) were recruited based on their educational level, prior survey experience, and willingness to spend 4 months on the project. Lead female interviewers and supervisors also received separate training from icddr,b staff on Verbal Autopsy Questionnaires. Training included lectures on how to complete the questionnaires, mock interviews between participants, practical training using tablets, and field practice. Representatives of ICF, NIPORT, Mitra and Associates, and icddr,b attended the training as resource persons.

The biomarker training took place from July 16 to July 30, 2022. The training involved a variety of different learning tools such as formal lectures on technical aspects of biomarker collection and on identifying eligible household members and administering informed consent procedures, videos to demonstrate the process of anthropometry and blood collection, hands-on demonstrations, group reading sessions, and in-house practice sessions.

Biomarker specialists were trained to measure the height and weight of children and adults using standard anthropometric procedures. The training included a description of their roles and familiarized them with the measurement equipment and materials and with the correct procedures to be followed when measuring and recording measurements of height and weight. A standardization exercise was conducted for measuring height and recumbent length of children under age 5. In the standardization exercise, the gold standard value was established by taking the average of two measurements made by the trainer. All of the measurers took two measurements on the same children as the trainer, and his or her average measurement was compared against the gold standard to assess accuracy.

The biomarker team was also trained to measure blood pressure for women and men using an automated digital blood pressure monitor. In addition, they were trained on carrying out blood glucose testing and the protocol for fasting plasma blood glucose measurements. To qualify for biomarker data collection, biomarker technicians had to have completed 3 years of the Medical Assistance Training Course, to be nurses, or to have a diploma and sufficient experience in biomarker data collection. The training on anemia testing was provided by the icddr,b trainers.

1.7 FIELDWORK

Fieldwork for the 2022 BDHS was carried out by 20 interviewing teams, each consisting of one male supervisor, one female lead interviewer, four female interviewers, two biomarker technicians (one male and one female), and one logistics staff person. Data collection occurred in four phases (each about 4 weeks in duration) beginning on June 27, 2022, and ending on December 12, 2022.

Data quality measures were implemented through several activities. Nine quality control officers (three men and six women) from Mitra and Associates traveled to the field to visit the interviewing teams throughout the data collection period. In addition, 10 quality control officers from NIPORT and six from icddr,b monitored the fieldwork extensively. The quality control officers went to the field in tours of about 3 weeks in each phase. They oversaw use of the materials from the household listing and mapping to identify selected households, observed one household and one individual interview conducted by each interviewer, and spot-checked completed questionnaires. The quality control officers also revisited the households of completed clusters for each survey team and checked whether eligible respondents in selected households were visited and properly identified and interviewed. At the end of each phase, a debriefing session was held to address problems encountered in the field, clarifications, and administrative matters. Data quality was also monitored through field check tables generated concurrently with data collection. The main purpose of the tables was to allow the quality control officers and ICF to advise field teams of problems detected during the fieldwork.

The interviewers used tablet computers for data collection. The tablet computers were equipped with Bluetooth® technology to enable remote electronic transfer of files, such as assignments from the team supervisor to the interviewers, individual questionnaires to survey team members, and completed questionnaires from interviewers to team supervisors.

1.8 DATA PROCESSING

The survey data were collected using tablet PCs running Windows 10.1 and Census and Survey Processing System (CSPro) software, jointly developed by the United States Census Bureau, ICF, and Serpro S.A. The Bangla language questionnaire was used for collecting data via computer-assisted personal interviewing. The CAPI program accepted only valid responses, automatically performed checks on ranges of values, skipped to the appropriate question based on the response given, and checked the consistency of the data collected. Answers to the survey questions were entered into the PC tablets by each interviewer. Supervisors downloaded interview data to their computer, checked the data for completeness, and monitored fieldwork progress.

Each day, after completion of interviews, field supervisors submitted data to the secured servers. Data were sent to the central office via the internet or other modes of telecommunication allowing electronic transfer of files. The data processing manager monitored the quality of the data received and downloaded completed files into the system. Secondary editing was conducted simultaneously with data collection. The concurrent data collection and processing offered a distinct advantage because it maximized the likelihood of the data being error-free and accurate. The paper Biomarker Questionnaires were compared with the electronic data file to check for any inconsistencies in data entry. The secondary editing of the data was completed on January 6, 2023. ICF provided applications in CSPro for data processing and offered technical assistance in preparation of the data editing programs. All technical support for data processing and use of PC tablets was provided by ICF.

1.9 RESPONSE RATES

Table 1.1 shows the results of the household and individual interviews and response rates according to residence for the 2022 BDHS. A total of 30,330 households were selected for the 2022 BDHS sample, of which 30,149 were found to be occupied. Of the occupied households, 30,018 were successfully interviewed, yielding a response rate of almost 100%. In the interviewed households, 30,358 ever-married

women age 15–49 were identified as eligible for individual interviews, among whom 20,217 were eligible for the full questionnaire and 10,141 were eligible for the short questionnaire. Overall, interviews were completed with 30,078 women, yielding a response rate of 99% in the sample as a whole. Response rates were 99% among women eligible for the full questionnaire and almost 100% among women eligible for the short questionnaire.

Table 1.1 Results of the household and individual interviews

HOUSING CHARACTERISTICS AND HOUSEHOLD POPULATION

2

Key Findings

- **Electricity:** 99% of households have access to electricity through the national grid or solar power, an increase from 91% in 2017–18.
- **Mobile phones:** Almost all households (98%) have a mobile phone. Sixty-seven percent of the de facto population age 13 and over owns a mobile phone (81% of males and 55% of females, an increase from 74% and 47%, respectively, in 2017–18).
- **Birth registration:** 42% of children under age 5 have had their birth registered, and 25% have a birth certificate. The percentage of children whose births were registered has increased since 2017–18 (from 25% to 42%).
- **Education:** 24% of females and 23% of males age 6 and older have no education.
- **School attendance:** The total net attendance ratios (NARs) are 68% for primary school and 48% for secondary school.
- **National identification card:** 90% of adults age 18 and older have a national identification (NID) card.

Information on the socioeconomic characteristics of the household population in the 2022 BDHS provides a context for interpreting demographic and health indicators and furnishes an approximate indication of the representativeness of the survey. The information also sheds light on the living conditions of the Bangladeshi population.

This chapter presents information on housing characteristics and household possessions, ownership of mobile phones, household wealth, household population and composition, birth registration, educational attainment, school attendance, organized learning, and ownership of a national identification (NID) card.

2.1 HOUSING CHARACTERISTICS

Almost all households in Bangladesh (99%) have access to electricity through the national grid and/or solar power. Although there is no difference in access to electricity through the national grid in urban and rural households (99% versus 98%), rural households are more likely to have access to electricity through solar power (16% versus 6%) (**Table 2.1**).

Overall, the most common flooring materials are earth, sand, or dung (50% of households) and cement (44% of households), but there are differences by urban and rural residence. Cement is the most common flooring material in urban households (67%), whereas earth, sand, or dung is most common in rural households (63%).

Most households use tin or metal as a roofing material (78%), followed by cement (20%). The most common materials used for walls are tin (43%) and cement or cement blocks (37%).

Twenty-six percent of households have only one room for sleeping; this pattern is more common in urban households than in rural households (31% versus 24%).

Trends: The percentage of households with access to electricity through the national grid has increased substantially over time, from 60% in 2011 to 99% in 2022.

2.2 HOUSEHOLD WEALTH

2.2.1 Household Durable Goods

The survey collected information on household effects, means of transportation, and ownership of agricultural land and farm animals. As shown in **Table 2.2**, almost all households have mobile phones (98%). Among household members age 13 and older, 67% own a mobile phone (81% of males and 55% of females) (**Table 2.3**).

Ninety-six percent of households have an electric fan, 59% have an almirah/wardrobe, 53% have a refrigerator, and 50% have a television. Only 6% of households own a computer/laptop (**Table 2.2**).

About one in four households (26%) own a bicycle, 12% have a motorcycle or scooter, and 5% have a rickshaw or van.

Ninety percent of households own agricultural land, and 60% own farm animals. Rural households are somewhat more likely than urban households to own agricultural land (93% versus 83%) and much more likely to own farm animals (73% versus 28%).

2.2.2 Wealth Index

Wealth index

Households are given scores based on the number and kinds of consumer goods they own, ranging from a television to a bicycle or car, and housing characteristics such as source of drinking water, toilet facilities, and flooring materials. These scores are derived using principal component analysis.

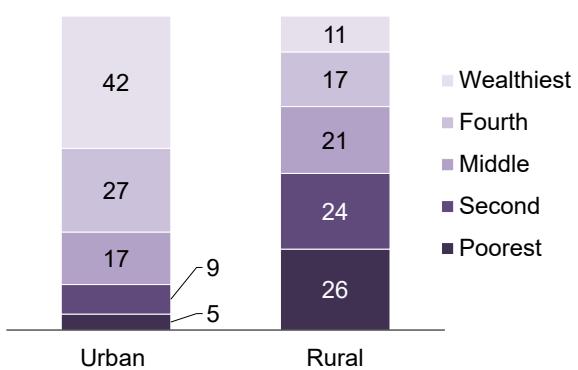

National wealth quintiles are compiled by assigning the household score to each usual (de jure) household member, ranking each person in the household population by his or her score, and then dividing the distribution into five equal categories, each comprising 20% of the population.

Sample: Households

Table 2.4 presents the distribution of the household population by wealth quintile according to residence and division. Urban households are more likely than rural households to fall into higher wealth quintiles, while rural households are more likely to fall into lower wealth quintiles. Sixty-nine percent of the urban population is concentrated in the two highest wealth quintiles, while 50% of the rural population falls in the lowest two wealth quintiles. Twenty-six percent of the rural population is in the lowest quintile, as compared with 5% of the urban population (**Figure 2.1**). Wealth varies widely by division. Thirty-four percent of the population in Dhaka is in the wealthiest quintile, compared with only 9% in both Rangpur and Mymensingh. Conversely, Mymensingh and Rangpur have the

Figure 2.1 Household wealth by residence

Percent distribution of de jure population by wealth quintiles

highest proportions of residents in the lowest quintile (36% and 33%, respectively), while Dhaka has the lowest proportion of residents in the lowest quintile (9%).

Table 2.4 also includes the Gini coefficient, a measure of the level of concentration of wealth, with 0 being an equal wealth distribution and 1 a totally unequal distribution. Wealth is distributed more evenly in the urban population than the rural population (0.21 versus 0.26).

2.3 HOUSEHOLD POPULATION AND COMPOSITION

Household

A person or group of related or unrelated persons who live together in the same dwelling unit(s), who acknowledge one adult male or female as the head of the household, who share the same housekeeping arrangements, and who are considered a single unit.

De facto population

All persons who stayed in the selected households the night before the interview (whether usual residents or visitors).

De jure population

All persons who are usual residents of the selected households, whether or not they stayed in the household the night before the interview.

How data are calculated

All tables are based on the de facto population unless otherwise specified.

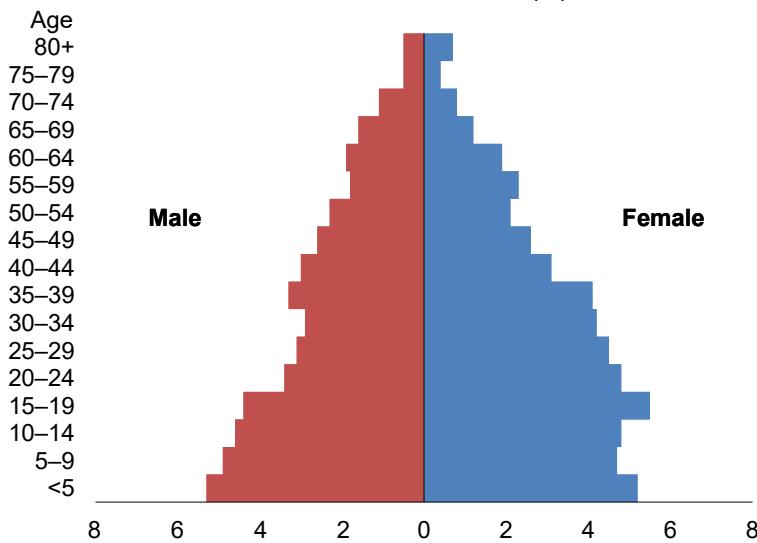

A total of 125,260 individuals stayed overnight in the 30,018 households interviewed in the 2022 BDHS. Forty-seven percent (59,230) of these individuals were male and 53% were female (66,030), yielding a sex ratio of 90 males per 100 females (**Table 2.5**).

The population pyramid in **Figure 2.2** illustrates the distribution of the population by 5-year age groups and sex. Children under age 15 account for 30% of the population, while individuals age 65 and older make up only 7%. Adolescents age 10–19 account for 19% of the population (**Table 2.5**).

Only 16% of households are headed by women. The average household consists of 4.1 usual members (**Table 2.6**).

Trends: The proportion of the household population under age 15 decreased from 32% in 2017–18 to 30% in 2022. Over the same time period, the percentage of female-headed households did not change (16%) and the average household size decreased slightly, from 4.3 to 4.1.

Figure 2.2 Population pyramid
Percent distribution of the household population

2.4 BIRTH REGISTRATION

Registered birth

Child has a birth certificate or child does not have a birth certificate, but the birth is registered with the civil authorities.

Sample: De jure children under age 5

Birth registration helps to ensure access to basic services, including immunization, health care, and school enrollment at the appropriate age (UNICEF 2005). Overall, 42% of children under age 5 have had their birth registered and 25% have a birth certificate (**Table 2.7**).

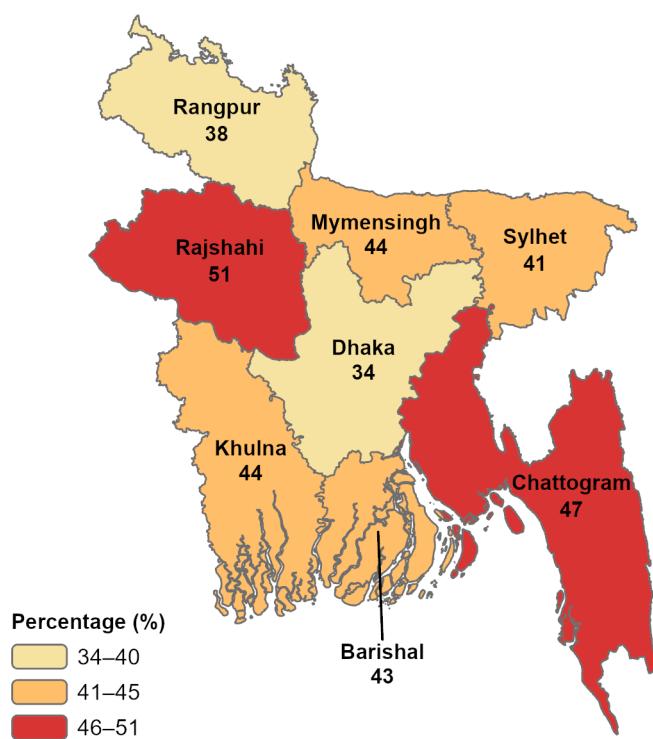

Trends: Birth registration declined from 31% in 2011 to 20% in 2014 but then increased to 25% in 2017–18 and 42% in 2022.

Patterns by background characteristics

- Birth registration increases with age; only 27% of children less than age 1 are registered, as compared with 46% of those age 1–4.
- By division, the percentage of de jure children whose births were registered with the civil authorities ranges from a low of 34% in Dhaka to a high of 51% in Rajshahi (**Map 2.1**).

Map 2.1 Birth registration by division

Percentage of de jure children under age 5 whose births are registered with the civil authorities

2.5 EDUCATION

2.5.1 Educational Attainment

Median educational attainment

Half of the population has completed less than the median number of years of schooling, and half of the population has completed more than the median number of years of schooling.

Sample: De facto household population age 6 and older

Table 2.8.1 and **Table 2.8.2** present information on the educational attainment of the de facto female household population and male household population age 6 and older, respectively. Overall, 24% of women and girls age 6 and over have no education, 19% have attended some primary school, 11% have completed primary school but advanced no further, 28% have attended some secondary school, 8% have completed secondary school but advanced no further, and 10% have more than a secondary education. Women and girls age 6 and over have completed a median of 4.6 years of schooling.

Twenty-three percent of men and boys age 6 and over have no education, 21% have attended some primary school, 12% have completed primary school but advanced no further, 23% have attended some secondary school, 8% have completed secondary school but advanced no further, and 13% have more than a secondary education. Men and boys age 6 and over have completed a median of 4.5 years of schooling, or 0.1 years less than women and girls age 6 and over.

Trends: Median years of schooling among women and girls increased from 2.9 years in 2011 to 4.6 years in 2022. Among men and boys, median years of schooling increased from 3.4 years to 4.5 years during the same time period.

Patterns by background characteristics

- The median number of years of schooling is higher in urban areas than rural areas among both females (5.7 years versus 4.4 years) and males (5.7 years versus 4.2 years) (**Table 2.8.1** and **Table 2.8.2**). Likewise, the percentage of females and males in rural areas with no education (26% and 25%, respectively) is greater than the percentage in urban areas (19% and 17%, respectively).
- Education varies by division; 29% of female household members in Mymensingh and Rangpur have no education, as compared with 18% in Barishal. Similarly, 30% of male household members in Mymensingh have no education, compared with 19% in Barishal.
- Educational attainment increases with increasing household wealth. Females in the lowest wealth quintile have completed a median of 2.5 years of schooling, as compared with a median of 7.8 years in the highest wealth quintile. The median number of years of schooling increases from 2.1 years among males in the lowest wealth quintile to 8.4 among those in the highest quintile. Thirty-six percent of both females and males in the lowest wealth quintile have no education, compared with 14% of females and 10% of males in the highest wealth quintile.

2.5.2 School Attendance

Net attendance ratio (NAR)

Percentage of the school-age population that attends primary or secondary school.

Sample: Children age 6–10 for primary school NAR and children age 11–17 for secondary school NAR

Gross attendance ratio (GAR)

The total number of children attending primary school divided by the official primary school-age population and the total number of children attending secondary school divided by the official secondary school-age population.

Sample: Children age 6–10 for primary school GAR and children age 11–17 for secondary school GAR

School attendance ratios are shown in **Table 2.9**. Sixty-eight percent of both girls and boys age 6–10 attend primary school. The net attendance ratio (NAR) drops in secondary school: 48% of girls and 49% of boys age 11–17 attend secondary school.

The gross attendance ratio (GAR) for primary school is 88% for girls and 89% for boys; the GAR for secondary school is 70% for both girls and boys.

Gender parity index (GPI)

The ratio of female to male students attending primary school and the ratio of female to male students attending secondary school. The index reflects the magnitude of the gender gap.

Sample: Primary school students and secondary school students

A gender parity index (GPI) of 1 indicates parity or equality between school participation ratios. A GPI lower than 1 indicates a gender disparity in favor of males, with a higher proportion of males than females attending the specified level of schooling. A GPI higher than 1 indicates a gender disparity in favor of females.

The GPI for the NAR at the primary school level is 0.99, indicating that in primary school there are slightly more male than female students. Similarly, at the secondary school level, the GPI for the NAR is 0.99, indicating that there are slightly more boys than girls attending secondary school (**Table 2.9**).

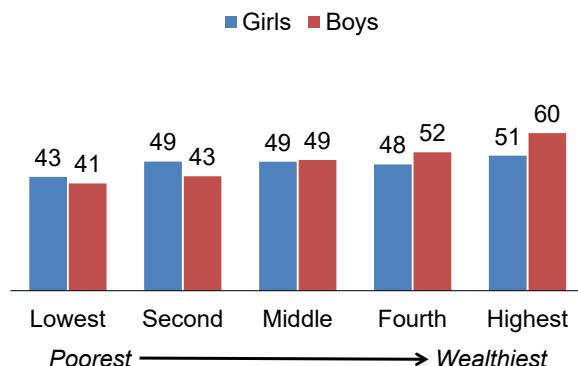

Patterns by background characteristics

- Both the total primary and secondary school GAR are higher among the rural population than the urban population. The primary school GAR is 90% for the rural population versus 85% for the urban population; the secondary school GAR is 72% for the rural population versus 67% for the urban population.
- At the primary school level, the total NAR ranges from a low of 66% in Barishal, Chattogram, and Dhaka to a high of 72% in Rajshahi. At the secondary school level, the total NAR ranges from 44% in Chattogram to 53% in both Rajshahi and Barishal.

- The primary school NAR is inversely related to household wealth, with the highest total NAR (72%) in the lowest wealth quintile (74% among girls and 70% among boys) and lowest total NAR (65%) in the highest quintile (64% among girls and 67% among boys). At the secondary school level, the total NAR increases with increasing wealth, from 42% in the lowest wealth quintile (43% among girls and 41% among boys) to 55% in the highest quintile (51% among girls and 60% among boys) (Figure 2.3).

Figure 2.3 Secondary school attendance by household wealth

Net attendance ratio for secondary school among children age 11–17

2.5.3 Participation Rate in Organized Learning among Children Age 5

Participation rate in organized learning: adjusted net attendance ratio (NAR)

Percentage of children 1 year younger than the official primary school entry age (at the beginning of the school year) who are attending an early childhood education program or primary school. The ratio is termed adjusted since it includes children in primary school.

Sample: Children age 5 at the beginning of the school year

Table 2.10 presents data on participation in organized learning. Fifty percent of children 1 year younger than the official lower basic school entry age at the beginning of the school year attend an early childhood education program, and 28% attend primary school. However, 22% do not attend either an early childhood education program or primary school. Overall, the adjusted net attendance ratio (NAR) for organized learning among children age 5 is 78%.

Patterns by background characteristics

- The adjusted net attendance ratio is higher in rural areas (79%) than in urban areas (75%).
- The adjusted NAR is slightly higher among girls than boys (80% versus 77%).
- Participation in an early childhood education program generally increases with increasing household wealth, rising from 42% in the lowest wealth quintile to 58% in the highest quintile. Similarly, the adjusted NAR increases from 70% in the lowest wealth quintile to 84% in the highest quintile.
- By division, the adjusted NAR is highest in Rangpur (84%) and lowest in Sylhet (70%).

2.6 OWNERSHIP OF AN NID CARD

All Bangladeshi citizens age 18 and older are eligible to receive a national identity (NID) card. The survey collected information on whether individuals in the household age 18 and older had an NID card. Overall, 90% of household members age 18 and older (92% of men and 89% of women) were reported to have a card (Table 2.11).

Ownership of a card increases with age; whereas 27% of the population age 18–19 has a card, ownership increases to 81% among those age 20–29 and 99% among those age 30 and above. There is little variation by residence; 91% of the rural population and 90% of the urban population have an NID card.

¹ Buffaloes, milk cows or bulls, goats or sheep, chickens or ducks, and other farm animals

Table 2.3 Ownership of mobile phones

Percentage of the de facto household population age 13 and over that has a mobile phone by age, according to residence and sex, Bangladesh DHS 2022

Age	Urban			Rural			Total		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
13–14	21.3	9.1	15.0	20.0	4.1	11.8	20.4	5.4	12.7
15–19	68.8	46.5	56.4	68.3	34.9	49.8	68.4	38.1	51.7
20–29	96.3	82.6	88.4	94.8	69.9	80.0	95.3	73.7	82.6
30–39	97.3	81.3	88.4	95.0	67.8	79.4	95.7	71.9	82.1
40–49	95.9	73.9	85.0	90.1	55.5	72.2	91.8	60.8	76.0
50+	81.7	52.4	67.5	67.5	35.5	52.0	71.0	39.7	55.8
Percentage with mobile phone	85.7	66.6	75.5	78.4	51.1	63.6	80.5	55.4	67.0
Number of persons	12,322	14,045	26,367	30,574	35,934	66,508	42,897	49,979	92,876

Table 2.4 Wealth quintiles

Percent distribution of the de jure population by wealth quintiles, and the Gini coefficient, according to residence and division, Bangladesh DHS 2022

Residence/division	Wealth quintile					Number of persons	Gini coefficient ¹
	Lowest	Second	Middle	Fourth	Highest		
Residence							
Urban	5.1	9.4	16.7	26.6	42.1	100.0	34,892 0.21
Rural	25.8	24.1	21.3	17.4	11.4	100.0	89,374 0.26
Division							
Barishal	30.8	28.9	16.5	11.2	12.7	100.0	7,520 0.33
Chittogram	20.0	22.8	21.3	17.5	18.4	100.0	23,357 0.28
Dhaka	8.9	12.1	19.5	25.7	33.8	100.0	30,762 0.26
Khulna	12.6	18.9	21.4	23.2	23.9	100.0	14,028 0.26
Mymensingh	35.7	24.0	17.4	14.3	8.7	100.0	9,978 0.29
Rajshahi	16.5	22.9	25.4	20.8	14.3	100.0	15,674 0.26
Rangpur	33.1	25.6	17.1	15.7	8.5	100.0	14,436 0.30
Sylhet	28.6	15.4	17.2	21.1	17.6	100.0	8,511 0.29
Total	20.0	20.0	20.0	20.0	20.0	100.0	124,266 0.27

¹ The Gini coefficient indicates the level of concentration of wealth, with 0 representing an equal wealth distribution and 1 representing a totally unequal distribution.

Table 2.5 Household population by age, sex, and residence

Percent distribution of the de facto household population by age groups and percentage of the de facto household population age 10–19, according to sex and residence, Bangladesh DHS 2022

Age	Urban			Rural			Total

¹ The NAR for primary school is the percentage of the primary school-age (6–10 years) population that is attending primary school. The NAR for secondary school is the percentage of the secondary school-age (11–17 years) population that is attending secondary school. By definition, the NAR cannot exceed 100.0.

² The GAR for primary school is the total number of primary school students, expressed as a percentage of the official primary school-age population. The GAR for secondary school is the total number of secondary school students, expressed as a percentage of the official secondary school-age population. If there are significant numbers of overage and underage students at a given level of schooling, the GAR can exceed 100.0.

³ The gender parity index for primary school is the ratio of the primary school NAR (GAR) for females to the NAR (GAR) for males. The gender parity index for secondary school is the ratio of the secondary school NAR (GAR) for females to the NAR (GAR) for males.

Table 2.10 Participation rate in organized learning

Percent distribution of children 1 year younger than the official primary school entry age at the beginning of the school year by attendance at an early childhood education program or primary school, and the adjusted net attendance ratio (NAR), according to background characteristics, Bangladesh DHS 2022

CHARACTERISTICS OF RESPONDENTS

Key Findings

- ***Education:*** The proportion of ever-married women with no education declined from 34% in 2007 to 14% in 2022. Furthermore, more than half (59%) of the women in Bangladesh have some secondary education or higher, an increase from 52% in 2017–18.
- ***Literacy:*** About 8 in 10 ever-married women are literate.
- ***Exposure to media and use of the internet:*** Half (51%) of women have no access to any mass media. Among those who do have access, television remains the most commonly used medium, despite viewership declining from 55% in 2017–18 to 48% in 2022. One in 5 women have used the internet in the past 12 months.
- ***Employment:*** Almost one-third (32%) of women are currently employed, a decrease from 48% in 2017–18.
- ***Occupation:*** Most ever-married women who are employed are involved in agricultural work (57%).

This chapter presents information on the demographic and socioeconomic characteristics of the survey respondents, such as age, education, wealth status, marital status, educational attainment, literacy, exposure to mass media, internet use, employment, occupation, health insurance coverage, and recent migration. This information is useful for understanding the factors that affect use of reproductive health services, contraceptive use, and other health behaviors.

3.1 BASIC CHARACTERISTICS OF SURVEY RESPONDENTS

The 2022 BDHS interviewed 30,078 ever-married women age 15–49. Most respondents (95%) are currently married, and more than half (59%) are under age 35. About 7 in 10 respondents (72%) reside in rural areas. The distribution of survey participants varies by division; Dhaka leads with 25% of respondents, whereas Sylhet and Barishal have the smallest proportions at 6% each (**Table 3.1.1**).

Fourteen percent of women have no education, but more than half (59%) have some secondary education or higher. Most respondents (90%) are Muslim, 8% are Hindu, and a small portion are Buddhist or Christian (1%).

3.2 EDUCATION AND LITERACY

Literacy

Respondents who had attended higher than secondary school were assumed to be literate. All other respondents were considered literate if they could read aloud all or part of a sentence shown to them.

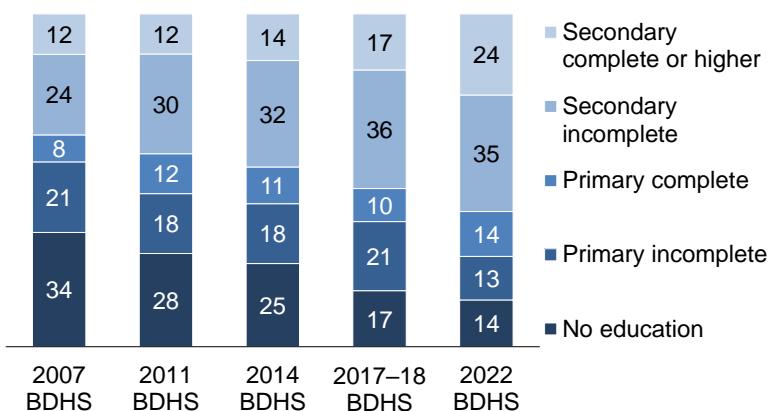

Sample: Ever-married women age 15–49

Almost a quarter (24%) of ever-married women have a secondary education or higher (**Table 3.2**). Overall, ever-married women age 15–49 have completed a median of 6.5 years of schooling. Almost 8 in 10 (78%) women are literate (**Table 3.3**).

Trends: There have been improvements in educational attainment among women in Bangladesh over the past 15 years. Since 2007, the percentage of ever-married women with no education has declined from 34% to 14% (**Figure 3.1**), while the overall literacy rate among women has increased from 55% to 78%. More than half (59%) of women have some secondary education or higher, an increase from 52% in 2017–18. Furthermore, the median number of years of schooling has increased to 6.5 years from 4.9 in 2017–18.

Figure 3.1 Trends in education among ever-married women, 2007–2022

Percent distribution of ever-married women age 15–49 by highest level of schooling attended or completed

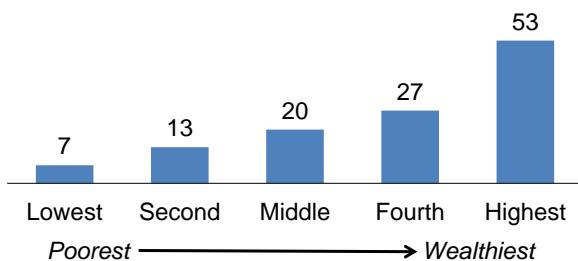

Note: Some columns may not add to 100% due to rounding.

Patterns by background characteristics

- Younger women tend to attain higher levels of education than their older counterparts. Thirty-five percent of women age 15–24 have completed secondary education or higher, as compared with only 11% of women age 45–49 (**Table 3.2**).
- The proportion of women with a secondary education or higher is greater in urban areas than in rural areas (34% and 20%, respectively).
- The proportion of women who have completed secondary education or higher is highest among those in the highest wealth quintile and lowest among those in the lowest wealth quintile (53% and 7%, respectively) (**Figure 3.2**).
- The percentage of women with a secondary education or higher is highest in Barishal (29%) and lowest in Sylhet (18%) (**Map 3.1**).

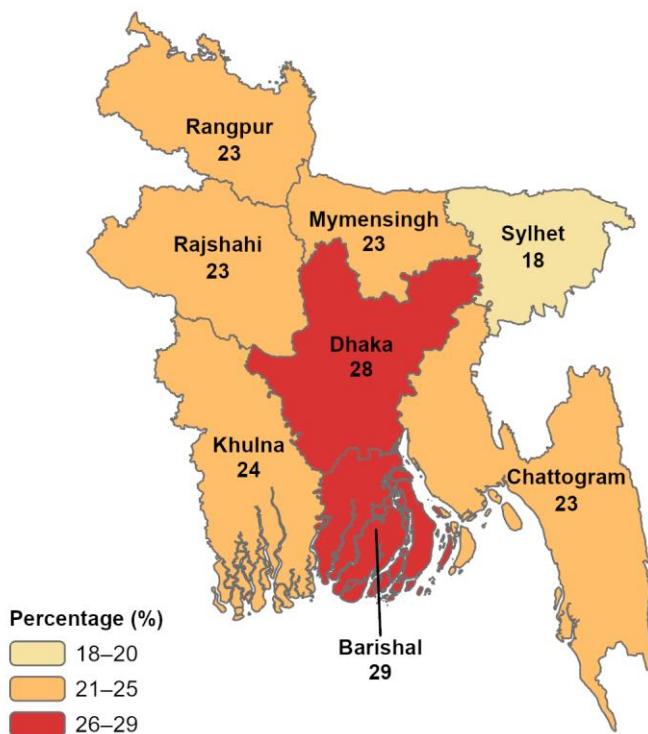

Figure 3.2 Secondary education by household wealth

Percentage of ever-married women age 15–49 with secondary education complete or higher

Map 3.1 Secondary education by division

Percentage of women and men age 15–49 with secondary education complete or higher

- Literacy is almost twice as high among young women age 15–24 (93%) as among women age 45–49 (47%) (Table 3.3).
- Literacy rates exhibit minor differences based on residence. The literacy rate for urban women (82%) is slightly higher than the rate for rural women (77%).
- By division, the proportion of literate women is highest in Barishal (84%) and lowest in Mymensingh (72%).
- The literacy rate increases with increasing household wealth, from 61% among women in households in the lowest wealth quintile to 93% among those in households in the highest wealth quintile.

3.3 MASS MEDIA EXPOSURE AND INTERNET USAGE

Exposure to mass media

Respondents were asked how often they read a newspaper, listened to the radio, or watched television. Those who responded *at least once a week* are considered regularly exposed to that form of media.

Sample: Ever-married women age 15–49

Use of the internet

Respondents were asked if they have ever used the internet from any device, if they used the internet in the past 12 months, and, if so, how often they used it during the past month.

Sample: Ever-married women age 15–49

Ever-married women age 15–49 were asked about their exposure to three types of mass media (television, radio, and newspaper) and about their use of the internet. Forty-eight percent of women indicated that they watch television at least once a week, while 3% reported reading the newspaper and 1% stated that they listen to the radio on a weekly basis. Over half of women (51%) are not regularly exposed to any of the three forms of media (**Table 3.4** and **Figure 3.3**). Only one in five women (20%) have ever used the internet; 20% used it in the past 12 months. Among women who used the internet in the past 12 months, nearly 78% used the internet almost every day in the past month, and 14% used the internet at least once a week (**Table 3.5**).

Trends: The percentage of women who reported listening to the radio at least once a week has decreased markedly since 2007, from 19% to 1%. The percentage of women who reported reading a newspaper has also decreased since 2007, from 7% to 3%. Conversely, the percentage of women who reported watching television gradually increased from 2007, reaching 55% in 2017–18, and then decreased to 48% in 2022.

Patterns by background characteristics

- Exposure to mass media varies little by age (**Table 3.4**).
- In contrast, internet use in the past 12 months is substantially higher among young women age 15–19 and age 20–24 (24% and 27%, respectively) than among women age 45–49 (9%) (**Table 3.5**).
- Rural women are more likely to have no access to any media sources than urban women (56% versus 37%). In addition, rural women are less likely to have ever used the internet (17% versus 28%).
- The proportion of women with no access to any of the three media is highest in Sylhet (70%) and lowest in Rajshahi (37%).
- Both exposure to mass media and use of the internet increase sharply with increasing educational attainment and household wealth. For example, 38% of women with a secondary education or higher and 40% of women from households in the highest wealth quintile have used the internet in the past 12 months, as compared with only 4% of women with no education and 5% of women in households from the lowest wealth quintile (**Figure 3.4**).

Figure 3.3 Exposure to mass media

Percentage of ever-married women age 15–49 who are exposed to media on a weekly basis

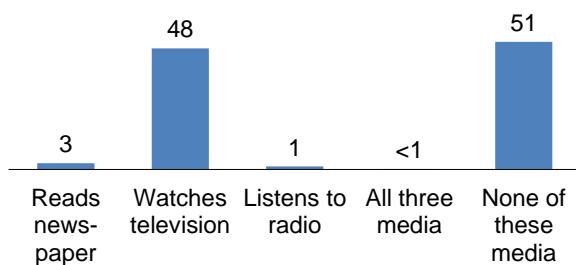

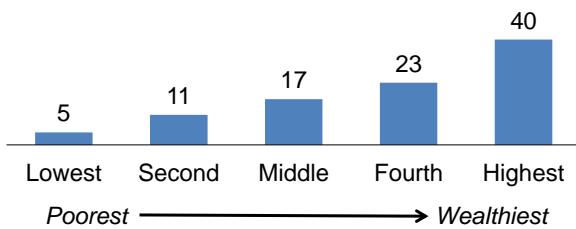

Figure 3.4 Internet usage by wealth

Percentage of ever-married women age 15–49 who used the internet in the past 12 months

3.4 EMPLOYMENT

Currently employed

Respondents who were employed in the 7 days before the survey.

Sample: Ever-married women age 15–49

Almost one-third of women (32%) are currently employed; 5% were employed in the past 12 months but are not currently employed, and 63% have not been employed in the past 12 months (**Table 3.6**).

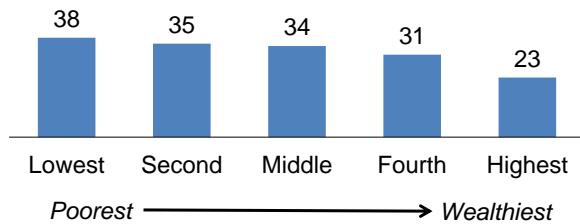

Trends: In the 2017–18 BDHS survey, 48% of women age 15–49 were employed, up from 33% in 2014 and 13% in 2011. The percentage of currently employed women declined to 32% in 2022.

Patterns by background characteristics

- Women age 35–39 have the highest rate of employment among all age groups (41%), while those age 15–19 have the lowest rate (11%) (**Table 3.6**).
- Divorced, separated, deserted, or widowed women have higher employment rates than women who are currently married (48% versus 31%).
- Women in rural areas have a higher employment rate than women in urban areas (33% versus 29%).
- The proportion of currently employed women is highest in Rajshahi (44%) and lowest in Sylhet (19%).
- The percentage of women who are employed is highest among those from households in the lowest wealth quintile (38%) and lowest among those from households in the highest wealth quintile (23%) (**Figure 3.5**).

Figure 3.5 Employment status by household wealth

Percentage of ever-married women age 15–49 who are currently employed

3.5 OCCUPATION

Occupation

Categorized as professional/technical/managerial, clerical, sales and services, skilled manual, unskilled manual, domestic service, agriculture, and other.

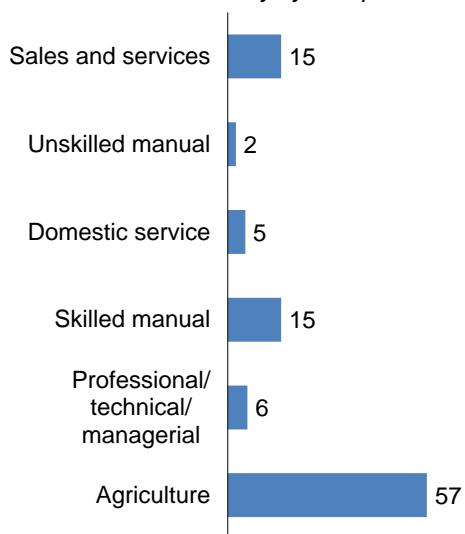

Sample: Ever-married women age 15–49 who were currently employed or had worked in the 12 months before the survey

More than half (57%) of ever-married women age 15–49 who were employed in the 12 months preceding the survey were involved in agriculture, while 15% were engaged in sales and services, 17% in skilled or unskilled manual work, and only 6% in professional, technical, or managerial work (**Table 3.7** and **Figure 3.6**).

Among employed women, 88% earn cash only and 4% receive cash and in-kind remuneration. Eight percent of women are not paid for their work. The proportion of women in the agricultural sector who work without being paid (11%) is higher than that of women in the nonagricultural sector (3%). Overall, 1 in 10 (10%) ever-married women are self-employed. Women working in the agricultural sector are more commonly employed by family members than those working in the nonagricultural sector (90% versus 79%). Eighty-one percent of employed women work year-round (**Table 3.8**).

Figure 3.6 Occupation

Percentage of ever-married women age 15–49 employed in the 12 months before the survey by occupation

Trends: In the 2017–18 BDHS survey, 65% of women age 15–49 were engaged in agricultural work (farming and poultry/cattle raising), up from 46% in 2014 and 32% in 2004. Women’s employment in agricultural work dropped to 57% in 2022.

Patterns by background characteristics

- Currently married women are more frequently involved in agriculture (59% versus 31%) and professional, technical, and managerial work (6% versus 4%) than divorced, separated, deserted, or widowed women (**Table 3.7**).
- Women in rural areas are more commonly involved in agricultural work than women in urban areas (68% versus 22%). In contrast, women in urban areas tend to be more engaged than rural women in professional, technical, and managerial work (13% versus 3%), sales and services (29% versus 11%), skilled or unskilled manual work (23% versus 16%), and domestic service (13% versus 2%).
- The percentage of women engaged in professional, technical, and managerial work (24%), sales and services (20%), and skilled or unskilled manual work (20%) is highest among those with a secondary education or higher. Women with no education are primarily engaged in agricultural work (62%).

3.6 HEALTH INSURANCE COVERAGE

Less than 1% of ever-married women age 15–49 have health insurance coverage (**Table 3.9**). Lack of insurance can result in individuals having to cover their own medical expenses, known as out-of-pocket expenditures. As a result, high costs may deter women from seeking medical attention or undergoing treatment. This financial burden can also impede their ability to save money or advance in other aspects of life.

3.7 RECENT MIGRATION

Recent migration

Percentage of respondents who were born outside of their current place of residence and moved to their current place of residence in the 5 years preceding the survey.

Sample: Ever-married women age 15–49 who were born outside their current place of residence

3.7.1 Type of Migration

Table 3.10 shows type of migration among women who moved to their current residence in the past 5 years. Almost 28% of women age 15–49 moved from one urban area to another, and 5% moved from one rural area to another. Migration from urban to rural areas (57%) exceeded migration from rural to urban areas (11%).

3.7.2 Reason for Migration

Women most commonly migrate for family-related reasons, including marriage formation (80%), family reunification and other family-related reasons (15%), and employment (5%) (**Table 3.11**).

Patterns by background characteristics

- The percentage of women who moved for employment is highest in Dhaka (14%) and lowest in Khulna (1%).
- The percentage of women who moved for family reunification and other family-related reasons is highest in Dhaka (27%) and lowest in Mymensingh (7%).
- The share of women who moved for employment is higher in urban areas than in rural areas (13% versus 2%).
- The share of women who moved for marriage formation is higher in rural areas than in urban areas (89% versus 57%).

Notes: Respondents who are visitors in the household are excluded from this table. Respondents who stated that they were born outside of Bangladesh and that they have always lived in their current place of residence were not asked about the reason for migration and are excluded from this table.

¹ Restricted to respondents who migrated within the past 5 years

MARRIAGE AND SEXUAL ACTIVITY

Key Findings

- **Age at first marriage:** The median age at first marriage among women age 20–49 has continued to rise slowly, increasing from 15.3 years in 2007 to 16.9 years in 2022. Fifty-one percent of women age 20–24 marry before age 18 (legal age of marriage).
- **Age at first sexual intercourse:** The median age at first sexual intercourse among women age 20–49 is the same as the median age at first marriage (16.9 years).
- **Spousal separation:** 16% of currently married women report that their husband lives elsewhere.
- **Education and work after marriage:** Eight in 10 women dropped out of school after marriage. Fifty-two percent of women working outside the home did not continue to work after marriage.

Marriage and sexual activity help determine the extent to which women are exposed to the risk of pregnancy. Thus, they are important determinants of fertility levels for any country. However, the timing and circumstances of marriage and sexual activity also have profound consequences for women's and men's lives.

This chapter presents information on marital status, age at first marriage, age at first sexual intercourse, recent sexual activity, spousal separation, perceptions regarding age at first marriage, and continuation of education and work after marriage.

4.1 MARITAL STATUS

Currently married

Women who report being married at the time of the survey. In this report, the terms currently in union and currently married are used interchangeably except where noted.

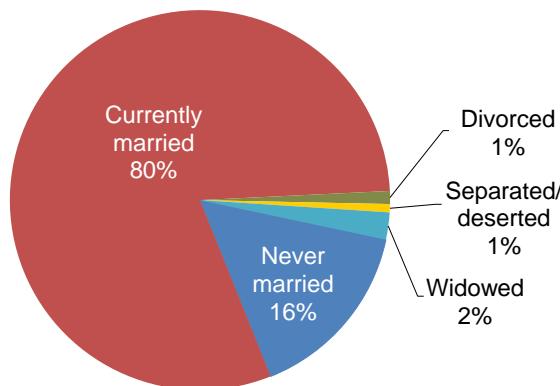

Sample: Women age 15–49

Table 4.1 presents information on the current marital status of women by age. In Bangladesh, 80% of women age 15–49 are currently married and 4% are divorced, separated/deserted, or widowed (**Figure 4.1**). The proportion of widowed women increases gradually with age and is highest among those age 45–49 (10%).

Sixteen percent of women age 15–49 have never been married. The proportion of never-married women falls sharply from 62% among those age 15–19 to less than 1% among those age 35 or older. The low proportion of women age 30 and older who have never been married (2%) indicates that marriage is nearly universal in Bangladesh (**Table 4.1**).

Figure 4.1 Marital status

Percent distribution of women age 15–49

4.2 AGE AT FIRST MARRIAGE

Median age at first marriage

Age by which half of respondents have been married.

Sample: Women age 20–49 and 25–49

Although the legal age of marriage for women in Bangladesh is 18, a large proportion of marriages still take place before women reach their legal age of marriage. The median age at first marriage among women age 20–49 is 16.9 years (**Table 4.2**).

Sixty-three percent of women age 20–49 were married by age 18, and 79% were married by age 20. Approximately one-fourth (27%) of women age 20–49 reported that they had married by age 15. Among young women age 20–24, 51% were married before age 18.

Trends: There has been a slow but steady increase over time in the median age at first marriage among women age 20–49, from 14.4 years in 1993–94 to 16.9 years in 2022. The proportion of women age 20–24 who were married by age 18 has declined over time, from 73% in 1993–94 to 51% in 2022 (**Figure 4.2**).

Patterns by background characteristics

- The median age at first marriage among women age 20–49 is relatively higher in the Eastern divisions (18.8 years in Sylhet and 17.6 years in Chattogram) and lower in the Western divisions (16.0 years in Khulna, Rajshahi, and Rangpur) (**Table 4.3**).
- The median age at first marriage increases slightly with increasing education. Women with a secondary education or higher marry 3.9 years later than women with no education (19.5 years versus 15.6 years) (**Figure 4.3**).
- Household wealth status is also correlated with median age at first marriage. Women in the highest wealth quintile marry 2 years later than women in the lowest quintile (18.3 years versus 16.3 years).

Figure 4.2 Trends in age at first marriage

Percentage of women age 20–24 who were first married by age 18

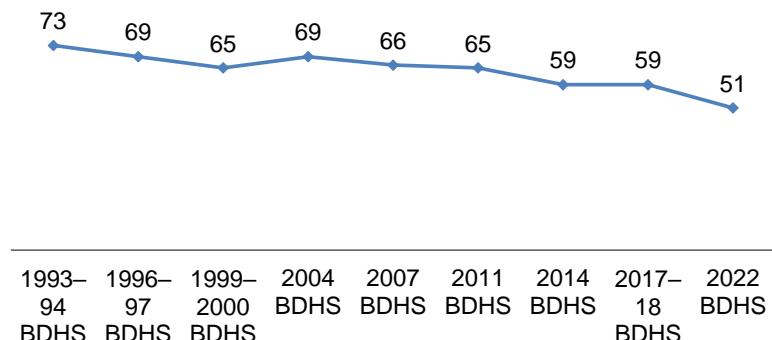

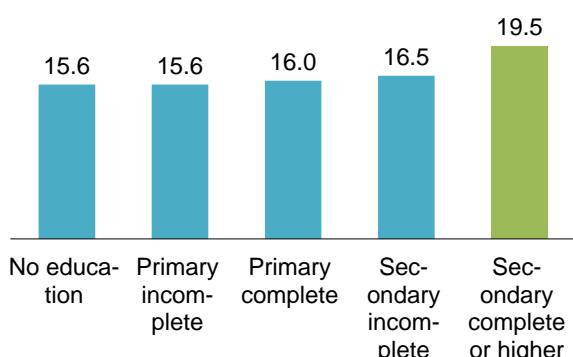

Figure 4.3 Women's median age at marriage by education

Median age at first marriage among women age 20–49

4.3 AGE AT FIRST SEXUAL INTERCOURSE

Median age at first sexual intercourse

Age by which half of respondents have had sexual intercourse.

Sample: Women age 20–49 and 25–49

In Bangladesh, the median age at first sexual intercourse among women age 20–49 is the same as the median age at first marriage for that age group (16.9 years) (**Figure 4.4**). One-fourth (25%) of women age 20–49 had sexual intercourse by age 15, while about two-thirds (63%) had sex by age 18 (**Table 4.4**).

Patterns by background characteristics

- Women age 20–49 from rural areas typically have their first sexual intercourse about a year earlier than those from urban areas (16.7 years versus 17.6 years) (**Table 4.5**).
- By division, the median age at first sexual intercourse among women age 20–49 is highest in Sylhet (18.6 years) and lowest in Khulna, Rajshahi, and Rangpur (16.1 years).
- Women age 20–49 with a secondary education or higher initiate sexual intercourse approximately 4 years later than women with no education (19.4 years versus 15.5 years).
- Among women age 20–49, the median age at first sexual intercourse is higher among those in the highest wealth quintile than among those in the lowest quintile (18.3 versus 16.3 years).

4.4 RECENT SEXUAL ACTIVITY

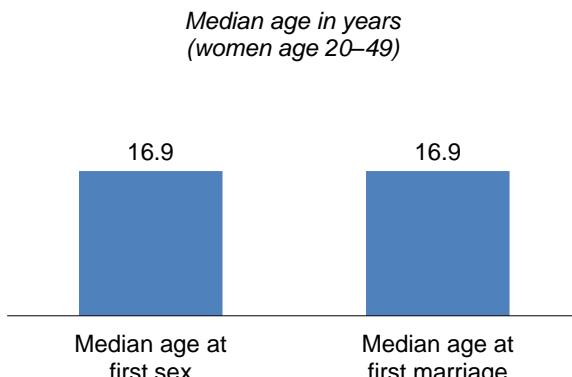

Sexual intercourse without use of contraception can increase a woman's possibility of becoming pregnant. Thus, information on recent sexual intercourse is important for refining measurement of exposure to pregnancy. During the interview, all ever-married women were asked how long ago their most recent sexual intercourse occurred.

Seventy-six percent of ever-married women had sexual intercourse within the 4 weeks preceding the survey. An additional 14% were most recently sexually active in the 12 months preceding the survey, while 10% had their most recent sexual intercourse 1 or more years prior to the survey (**Table 4.6**).

Patterns by background characteristics

- The proportion of women who were sexually active in the 4 weeks preceding the survey is lower among those age 45–49 (69%) than among those in the younger age groups (75%–79%) (**Table 4.6**).
- There are variations in recent sexual activity by administrative division. The proportion of women who reported being sexually active in the past 4 weeks ranges from a low of 67% in Chattogram to a high of 82% in Rangpur and Rajshahi.

Figure 4.4 Median age at first sex and first marriage

Median age at first marriage

Median age at first sex

4.5 SPOUSAL SEPARATION

The effect of spousal separation in reducing fertility varies with the length of separation. The cumulative impact of spousal separation would be expected to be greatest in areas of relatively high fertility and low prevalence of modern contraceptive use. Overall, 16% of currently married women in Bangladesh report that their husband lives elsewhere (**Table 4.7**).

Patterns by background characteristics

- Spousal separation rates are higher among younger women. For instance, 22% of women age 15–19 report living separately from their husband, as compared with 8% of women age 45–49 (**Table 4.7**).
- Spousal separation is higher among rural women (18%) than among urban women (13%).
- By division, 28% of women in Chattogram have husbands who live elsewhere, compared with 18% in Sylhet and 9% in Rangpur.
- The percentage of women who live separately from their husband rises with increasing education, from 8% among those with no education to 22% among those with a secondary education or higher.

4.6 PERCEPTIONS REGARDING AGE AT FIRST MARRIAGE

During the interview, all ever-married women were asked whether they thought their marriage took place at an appropriate age. More than half (57%) of women reported that their marriage took place at an appropriate age. However, one-third (33%) reported that they would have preferred to marry later, and 10% would have preferred to marry at an earlier age (**Table 4.8**).

Patterns by background characteristics

- Younger women age 15–17 are less likely to say their marriage occurred at the right time than women age 21–49 (24% versus 58%). Additionally, 60% of young women in the 15–17 age group reported they wished they had married later, as compared with 32% of women in the 21–49 age group (**Table 4.8**).
- The proportion of women who think that their marriage took place at the right age varies by division, from a high of 72% in Sylhet to a low of 46% in Rajshahi.
- Women with a secondary education or higher are more likely to believe they married at the right age (77%) than women who have less education (49%–53%).

4.7 CONTINUATION OF EDUCATION AND WORK AFTER MARRIAGE

Attending school and working outside the home after marriage are important for women's autonomy. The 2022 BDHS results showed that 82% of women did not continue school after marriage. Only 2% continued their education for 5 or more years (**Table 4.9**). More than half (52%) of women who were working outside the home before marriage did not continue to work after marriage, while 22% continued to work for 5 or more years (**Table 4.10**).

Patterns by background characteristics

- Young women age 15–17 are less likely to have stopped their education after marriage than women age 21–49 (76% versus 83%) (**Table 4.9** and **Table 4.10**).
- Women in rural areas are more likely to stop working after marriage than those in urban areas (54% and 48%, respectively).

- The percentage of women who reported discontinuing education after marriage is highest among those from households in the lowest wealth quintile (93%) and lowest among those from households in the highest wealth quintile (68%).

LIST OF TABLES

For more information on marriage and sexual activity, see the following tables:

- Table 4.9 Continuation of education after marriage**
- Table 4.10 Continuation of work after marriage**

Table 4.1 Current marital status

Percent distribution of women age 15–49 by current marital status, according to age, Bangladesh DHS 2022

Age	Marital status					Total	Percentage of respondents currently in union	Number of respondents
	Never married	Currently married	Divorced	Separated/deserted	Widowed			
15–19	61.6	37.5	0.5	0.3	0.1	100.0	37.5	6,713
20–24	17.6	80.5	1.0	0.8	0.2	100.0	80.5	5,964
25–29	4.6	92.9	1.3	0.6	0.4	100.0	92.9	5,533
30–34	1.1	95.0	1.8	0.7	1.4	100.0	95.0	5,172
35–39	0.4	94.7	1.1	1.0	2.8	100.0	94.7	5,128
40–44	0.5	91.3	1.2	1.0	6.0	100.0	91.3	3,849
45–49	0.3	87.1	1.3	0.8	10.4	100.0	87.1	3,268
Total	15.6	80.3	1.1	0.7	2.3	100.0	80.3	35,627

Note: Because the BDHS 2022 survey was based on a sample of ever-married women, the number of women in the table was increased using a factor based on all de facto women listed in the household who had never been married. The “all women” factors were based on age in the household and background information available at the household level. Women who have never been married are assumed to have never been pregnant. Because the number of all women is not normalized, the weighted numbers will not necessarily sum to the total.

Table 4.2 Age at first marriage

Percentage of women age 15–49 who were first married by specific exact ages and median age at first marriage, according to current age, Bangladesh DHS 2022

Current age	Percentage first married by exact age:					Percentage never married	Number of respondents	Median age at first marriage
	15	18	20	22	25			
15–19	10.4	na	na	na	na	62.1	4,564	a

Key Findings

- **Total fertility rate:** The total fertility rate (TFR) in Bangladesh is 2.3 children per woman. The goal of the 4th Health, Population and Nutrition Sector Program (HPNSP) was to achieve a TFR of 2.0 by 2023. However, the TFR has not changed since 2011.
- **Birth intervals:** The median birth interval is 59.2 months. Ten percent of births occur within 24 months after the preceding live birth.
- **Postpartum insusceptibility:** The median duration of postpartum insusceptibility is 4.4 months. The median duration of postpartum amenorrhea decreased from 5.8 months in 2007 to 3.2 months in 2022.
- **Age at first birth:** The median age at first birth among women age 20–49 is 19.4 years. Thirty-five percent of women gave birth before age 18.
- **Teenage childbearing:** 24% of women age 15–19 have begun childbearing, a decline of 7 percentage points since 2014.
- **Miscarriages and induced abortions:** Among women age 15–49, 11% have had a miscarriage and 3% have had an induced abortion.

The number of children that a woman bears depends on many factors, including the age she begins childbearing, how long she waits between births, and her fecundity. Postponing first births and extending the interval between births have played a role in reducing fertility levels in many countries. These factors also have positive health benefits. In contrast, short birth intervals—of less than 24 months—can lead to harmful outcomes for both the newborn and the mother, such as preterm birth, low birth weight, and death. Childbearing at a very young age is associated with an increased risk of complications during pregnancy and childbirth and higher rates of neonatal mortality.

This chapter describes the current level of fertility in Bangladesh and some of its proximate determinants. It presents information on the total fertility rate, birth intervals, insusceptibility to pregnancy (because of postpartum amenorrhea, postpartum abstinence, or menopause), age at first birth, teenage pregnancy, and induced abortion rates.

5.1 CURRENT FERTILITY

Total fertility rate

The average number of children a woman would have by the end of her childbearing years if she bore children at the current age-specific fertility rates. Age-specific fertility rates are calculated for the 3 years before the survey, based on detailed pregnancy histories provided by women.

Sample: Women age 15–49

The total fertility rate (TFR) in Bangladesh is 2.3 children per woman (**Table 5.1**). Bangladeshi women have a pattern of early childbearing. The age-specific fertility rate rises from 92 births per 1,000 women in the 15–19 age group to a peak of 153 births per 1,000 women in the 20–24 age group and declines thereafter.

Figure 5.1 Trends in fertility by residence

Trends: The TFR declined from 3.4 births per woman in 1993–94 to 2.3 births per woman in 2022.

Since 2011, the TFR has remained steady at around 2.3 births per woman. The decrease in the TFR has been more pronounced in rural areas, dropping from 3.5 births per woman in 1993–94 to 2.4 in 2022, than in urban areas, where it fell from 2.7 to 2.1 births per woman over the same period (**Figure 5.1**).

Trends in the age-specific fertility rate indicate that the TFR has consistently been highest among women age 20–24 (**Table 5.2.1**). The largest absolute change in fertility has also occurred in this age group, with the rate declining from 191 births per 1,000 women in 2004 to 153 births per 1,000 women in 2022 (**Table 5.2.2** and **Figure 5.2**).

Patterns by background characteristics

- The TFR is lower in urban areas (2.1 births per woman) than in rural areas (2.4 births per woman). The percentage of women who are currently pregnant is also lower in urban than rural areas (4.3 versus 5.0) (**Table 5.3.1**).
- The connection between the TFR and women's educational level is not linear. Women with no education or a secondary or higher education have an average of 2.4 children, while those with a primary education have an average of 2.6 children. At the same time, the average number of children ever born to women age 15–49 correlates inversely with mother's educational attainment. Those with no education have an average of 3.5 children, whereas those with a secondary education or higher have an average of 2.3 children.
- The TFR is lowest in Rajshahi (2.0 children per woman), followed by Khulna (2.2 children per woman), Dhaka (2.2 children per woman), and Sylhet (2.3 children per woman), and highest in Mymensingh (2.7 children per woman). Four divisions, namely Barishal, Chattogram, Mymensingh, and Rangpur, have TFRs of 2.5 or above (**Map 5.1**).

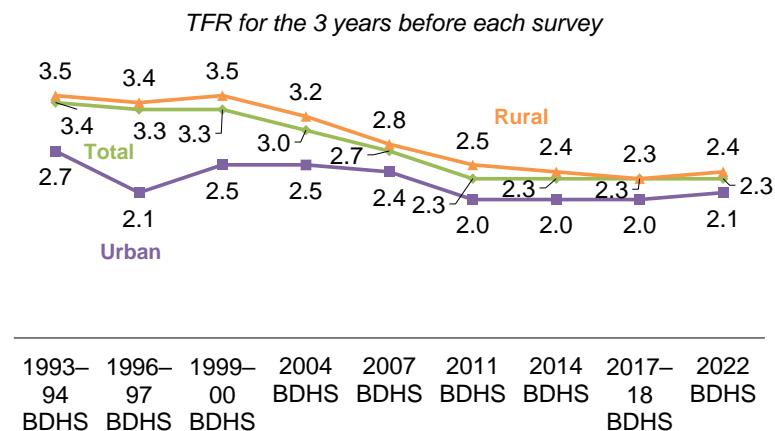

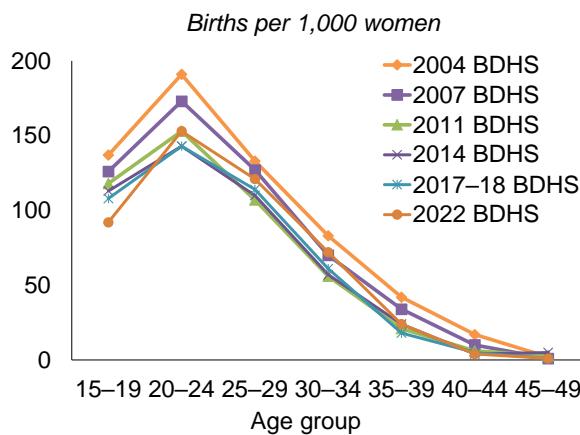

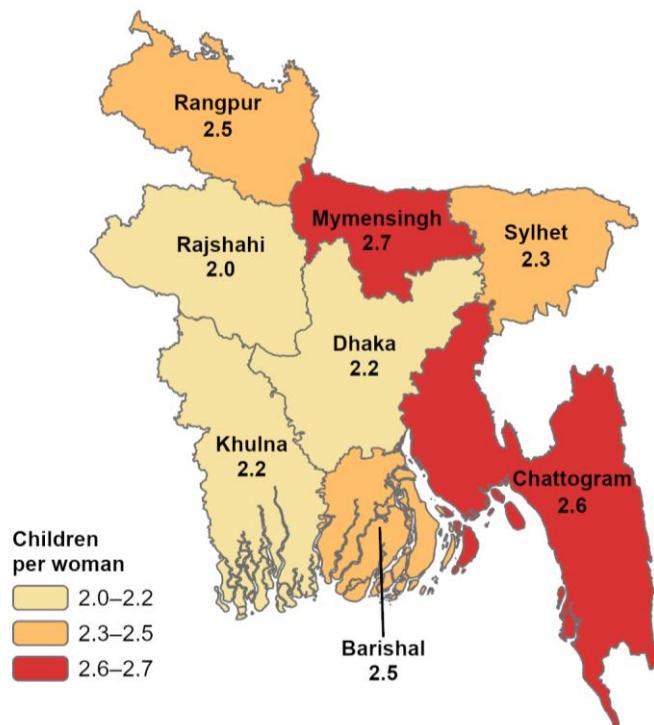

Figure 5.2 Trends in age-specific fertility

Map 5.1 Fertility by division

Total fertility rate for the 3 years before the survey

- The TFR decreases with increasing wealth. Women in the lowest wealth quintile have 0.8 more children than those in the highest quintile (2.8 and 2.0, respectively) (**Figure 5.3**).
- The age-specific fertility rate is highest among women age 20–24 in all divisions; within this age group, the rate is highest in Mymensingh (181 per 1,000 women) (**Table 5.3.2**).

5.2 CHILDREN EVER BORN AND LIVING

Among all women, the mean number of children ever born is 1.8; among currently married women, it is 2.2. Currently married women have an average of 2.0 living children. The number of children ever born increases with women's age; on average, women age 45–49 have given birth to 3.3 children, of whom 3.0 were still living at the time of the survey. In Bangladesh, 2% of currently married women age 45–49 have never given birth. Since voluntary childlessness is rare, this is often viewed as a measure of primary sterility (**Table 5.4**).

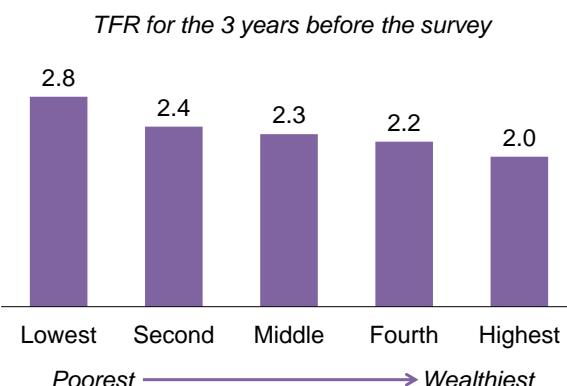

5.3 BIRTH INTERVALS

Median birth interval

Number of months since the preceding birth by which half of children are born.

Sample: Non-first births in the 5 years before the survey

Figure 5.3 Fertility by household wealth

Birth intervals are generally long in Bangladesh, with a median interval of 59.2 months. More than three quarters (78%) of non-first births occur 36 or more months after the previous birth, while 12% take place within 24–35 months (**Table 5.5**).

One in 10 women (10%) give birth less than 24 months after the preceding birth, 6% between 18 and 23 months, and 4% between 7 and 17 months (**Figure 5.4**). Almost half of women (49%) give birth more than 59 months after the preceding birth.

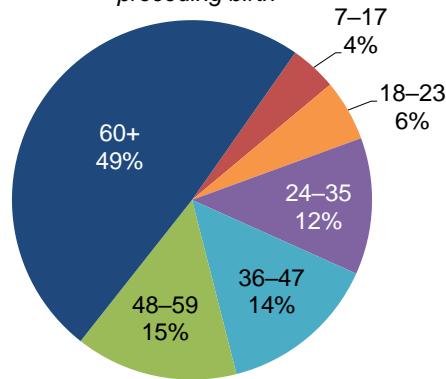

Trends: The median birth interval among women in Bangladesh has increased substantially over time, from 34.7 months in 1993–94 to 55.7 months in 2017–18 and 59.2 months in 2022.

Patterns by background characteristics

- The percentage of non-first births occurring 7–17 months after the preceding birth is higher among women age 15–19 (27%) than among women age 20–29 (5%) (**Table 5.5**).
- There is an association between length of birth interval and the survival status of the preceding sibling. The median birth interval is shorter when the preceding sibling has died (29.8 months) than when the preceding sibling is still alive (60.6 months). The percentage of births occurring within a short interval (7–17 months) is seven times higher when the preceding sibling died than when the preceding sibling survived (22% and 3%, respectively).
- Length of birth interval varies by administrative division. The median birth interval is longest in Rangpur (68 months) and shortest in Sylhet (42 months).

Figure 5.4 Birth intervals

Percent distribution of non-first births by number of months since the preceding birth

5.4 INSUSCEPTIBILITY TO PREGNANCY

Postpartum amenorrhea

The period of time after the end of a pregnancy and before the resumption of menstruation.

Postpartum abstinence

The period of time after the end of a pregnancy and before the resumption of sexual intercourse.

Postpartum insusceptibility

The period of time during which a woman is considered not at risk of pregnancy because she is postpartum amenorrheic and/or abstaining from sexual intercourse postpartum.

Median duration of postpartum amenorrhea

Number of months after the end of a pregnancy by which time half of women have begun menstruating.

Sample: Women who had a live birth or stillbirth in the 3 years before the survey

Median duration of postpartum insusceptibility

Number of months after the end of a pregnancy by which time half of women are no longer protected against pregnancy by either postpartum amenorrhea or abstinence from sexual intercourse.

Sample: Women who had a live birth or stillbirth in the 3 years before the survey

The median duration of postpartum amenorrhea among women who gave birth in the 3 years before the survey is 3.2 months, the median duration of abstinence is 2.6 months, and the median duration of postpartum insusceptibility is 4.4 months. The period of postpartum amenorrhea is considerably longer than the period of postpartum abstinence and is by far the major determinant of the length of postpartum insusceptibility to pregnancy (**Table 5.6**).

The proportion of births in the 3 years preceding the survey for which mothers are insusceptible decreases with the number of months since delivery, from 90% in the first 2 months after birth to 9% at 22–23 months. At 6 to 7 months after birth, 29% of women are still amenorrheic, while only 12% are abstaining.

Trends: The median duration of postpartum amenorrhea has steadily decreased over time, from 10.4 months in 1993–94 to 5.8 months in 2007 and 3.2 months in 2022. The median duration of insusceptibility decreased from 10.9 months in 1993–94 to 4.0 months in 2014. It then rose to 5.1 months in 2017–18, only to drop again to 4.4 months in 2022.

Patterns by background characteristics

- The median duration of postpartum amenorrhea is 2.0 months longer among women age 30–49 than among women age 15–29 (4.9 and 2.9, respectively) (**Table 5.7**).
- The median duration of insusceptibility varies among administrative divisions, from 3.3 months in Barishal to 5.0 months in Chattogram.
- The median duration of postpartum insusceptibility is longer among women in the highest wealth quintile than among women in the lowest quintile (4.9 months versus 4.3 months).

5.5 ARRIVAL OF MENOPAUSE

Menopause

Women are considered to have reached menopause if they are neither pregnant nor postpartum amenorrheic and have not had a menstrual period in the 6 months before the survey, if they report being menopausal or having had a hysterectomy, or if they have never menstruated.

Sample: Women age 30–49

In Bangladesh, 19% of women age 30–49 are menopausal. The proportion of menopausal women increases with age, from 5% among those age 30–34 to 64% among those age 48–49 (**Table 5.8**).

Trends: The proportion of women age 30–49 who are menopausal increased from 20% in 2011 to 23% in 2017–18 before declining to 19% in 2022.

5.6 AGE AT FIRST BIRTH

Median age at first birth

Age by which half of women have had their first child.

Sample: Women age 20–49 and 25–49

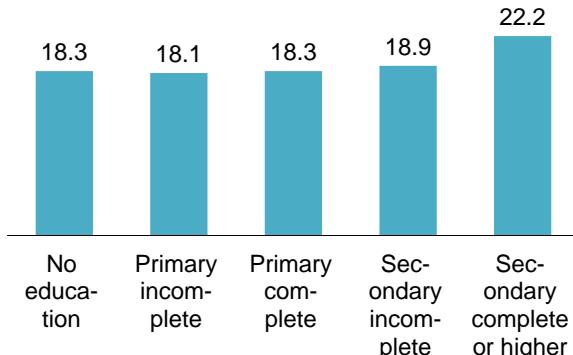

Bearing children at a young age involves substantial risks to the health of both the mother and the child. Early childbearing also tends to restrict educational and economic opportunities for women. In Bangladesh, the median age at first birth among women age 20–49 is 19.4 years. Thirty-five percent of women gave birth before age 18, while 57% gave birth before age 20 (**Table 5.9**).

Patterns by background characteristics

- Among women age 25–49, the median age at first birth is 1.0 years higher in urban areas than in rural areas (19.9 years versus 18.9 years) (**Table 5.10**).
- The median age at first birth varies by mother's education. The median age is 18.3 years among women with no education, as compared with 22.2 years among those with a secondary or higher education (**Figure 5.5**).
- Socioeconomic status influences the median age at first birth: it is lowest (18.7 years) among women in the lowest wealth quintile and highest (20.6 years) among those in the highest quintile.

Figure 5.5 Median age at first birth by education

Median age at first birth among women age 25–49

5.7 TEENAGE PREGNANCY

Teenage pregnancy

Percentage of women age 15–19 who have ever been pregnant.

Sample: Women age 15–19

In Bangladesh, 24% of teenage girls age 15–19 have begun childbearing; 18% have had a live birth, and another 6% are currently pregnant (**Table 5.11**).

Eight percent of women age 15–19 initiated sexual intercourse before age 15. Within this same age group, 10% of women were married before age 15 and 2% had a live birth (**Table 5.12**).

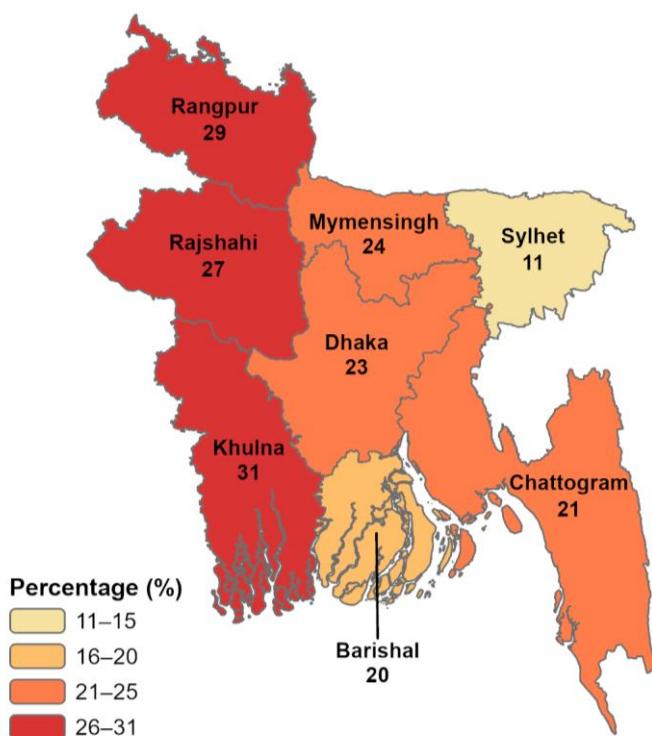

Trends: The proportion of women age 15–19 who have begun childbearing (including women who have had a live birth or are pregnant with their first child and excluding those who have had only a pregnancy loss) declined from 31% in 2014 to 24% in 2022.

Patterns by background characteristics

- The proportion of women age 15–19 who have begun childbearing increases with age, from 4% among those age 15 to 50% among those age 19 (**Table 5.11**).
- Teenage pregnancy is more common in rural areas than urban areas (25% versus 20%).
- The proportion of young women who have begun childbearing is lowest in Sylhet (11%) and highest in Khulna (31%) (**Map 5.2**).

Map 5.2 Teenage pregnancy by division

Percentage of women age 15–19 who have ever been pregnant

- Teenage childbearing is associated with educational attainment among women age 15–19. Specifically, only 24% of teenagers who have completed a secondary or higher education have begun childbearing, as compared with 38% of those with an incomplete primary education.
- Socioeconomic status impacts teenage childbearing: 29% of teenagers in the lowest wealth quintile have begun childbearing, compared with 14% in the highest wealth quintile.

5.8 PREGNANCY OUTCOMES AND INDUCED ABORTION RATES

Pregnancy outcomes

Live birth: a child who was born alive, even if for a very short time

Stillbirth: a child who was born dead (no signs of life) following a pregnancy that lasted 7 months (28 weeks) or longer

Miscarriage: a pregnancy that ended involuntarily before completing 7 months (28 weeks)

Induced abortion

Induced abortion: a pregnancy that was voluntarily ended

Sample: Pregnancies among women age 15–49 ending in the 3 years preceding the survey

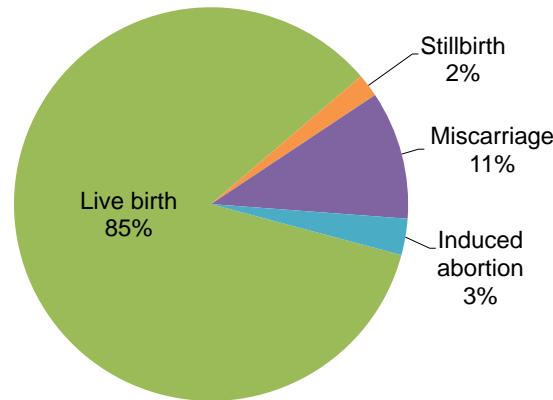

Eighty-five percent of pregnancies in the 3 years preceding the survey ended in a live birth, 11% resulted in a miscarriage, 3% led to an induced abortion, and 2% ended in a stillbirth (**Figure 5.6** and **Table 5.13**). The total abortion rate in Bangladesh is 0.1 abortions per woman (**Table 5.14**). The abortion rate is highest among women age 25–29 (4 abortions per 1,000 women), followed by women age 20–24 (3 abortions per 1,000 women) and women age 30–34 (3 abortions per 1,000 women).

Patterns by background characteristics

- The miscarriage rate is higher in urban areas (13%) than rural areas (10%). Induced abortion is also more common in urban areas than rural areas (4% versus 2%) (**Table 5.13**).
- Both miscarriages and induced abortions are most common among women age 35–44 (18% and 7%, respectively) and women age 25–34 (11% and 3%, respectively).
- The likelihood of miscarriage increases with birth order. Nine percent of first pregnancies resulted in miscarriages, as compared with 17% of fifth- or higher-order pregnancies.
- By division, miscarriage rates range from 8% in Chattogram to 12% in Dhaka, while induced abortion rates range from 1% in Mymensingh to 4% in Rangpur.
- The likelihood of miscarriage increases with increasing household wealth, from 8% among pregnancies to women in the lowest wealth quintile to 12% among pregnancies to women in the highest wealth quintile.

Figure 5.6 Pregnancy outcome

Percent distribution of pregnancies ending in the 3 years before the survey

LIST OF TABLES

Total	4.2	5.5	12.3	14.3	14.6	49.1	100.0	8,215	59.2

Note: First-order live births are excluded. The interval for multiple births is the number of months since the preceding pregnancy that ended in a live birth.

a = omitted because less than 50% of women had a birth before reaching the beginning of the age group

b= omitted because less than 50% of women had a preceding birth interval less than the maximum (70 months) for the category.

Table 5.6 Postpartum amenorrhea, abstinence, and insusceptibility

Percentage of live births and stillbirths in the 3 years preceding the survey for which mothers are postpartum amenorrheic, abstaining, and insusceptible, by number of months since birth, and median and mean durations, Bangladesh DHS 2022

Months since birth	Percentage of births for which the mother is:			Number of births ²
	Amenorrheic	Abstaining	Insusceptible ¹

¹ Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal death in pregnancies lasting 7 or more months.

² Miscarriages are fetal deaths in pregnancies lasting less than 28 weeks. When pregnancy duration is reported in months, miscarriages are fetal death in pregnancies lasting less than 7 months.

Table 5.14 Induced abortion rates

Age-specific and total induced abortion rates, and general abortion rates, for the 3 years preceding the survey, according to residence, Bangladesh DHS 2022

Age group	Residence		Total
	Urban	Rural	
10–14	[0]	[0]	[0]
15–19	2	1	2
20–24	3	2	3
25–29	4	2	4
30–34	3	3	3
35–39	3	1	2
40–44	1	0	1
45–49	[1]	[0]	[0]
TAR (15–49)	0.1	0.0	0.1
GAR	3	2	2

Note: Age-specific induced abortion rates are per 1,000 women. Estimates in brackets are truncated. Rates are for the period 1–36 months preceding the interview. Rates for the 10–14 age group are based on retrospective data from women age 15–17.

TAR: total induced abortion rate, expressed per woman

GAR: general induced abortion rate, expressed per 1,000 women age 15–44

FERTILITY PREFERENCES

Key Findings

- **Desire for another child:** 13% of currently married women want to have another child within the next 2 years, and 19% want to wait at least 2 years.
- **Limiting childbearing:** 57% of currently married women do not want another child or are sterilized. The percentage of women who want no more children has declined since 2011 (from 65% to 57%).
- **Ideal number of children:** On average, the ideal number of children among women is 2.3.
- **Unwanted births:** Overall, 81% of current pregnancies and live births in the past 3 years were wanted, 12% were mistimed, and 7% were unwanted.
- **Wanted fertility:** The total wanted fertility rate is 1.3 children, while the actual total fertility rate (TFR) is 2.3 children. On average, women have one child more than they want.

Information on fertility preferences can help family planning program planners assess the desire for children, the extent of mistimed and unwanted pregnancies, and the demand for contraception to space or limit births. This information suggests the potential trajectory of fertility trends in the future.

This chapter presents information on whether and when married women want more children, their ideal number of children, whether the last birth was wanted, and the theoretical fertility rate if all unwanted births were prevented.

6.1 DESIRE FOR ANOTHER CHILD

Desire for another child

Women were asked whether they wanted more children and, if so, how long they would prefer to wait before the birth of the next child. Women who are sterilized are assumed not to want any more children.

Sample: Currently married age 15–49

Overall, only 13% of currently married women age 15–49 want to have another child within 2 years; 19% would prefer to wait 2 or more years, and 57% want no more children or are sterilized (**Table 6.1**).

The proportion of women who want to have another child decreases as the number of living children increases. For example, 65% of currently married women with no children want to have a child within 2 years, as compared with less than 1% of women with four or more children (**Table 6.1**).

Trends: Overall, the proportion of currently married women age 15–49 who want no more children declined from 65% in 2011 to 57% in 2022 (**Figure 6.1**). The proportion of women with two children who want no more children increased from 68% in 2004 to 82% in 2011 before declining to 72% in 2022. The proportion of women with three children who want to limit childbearing has decreased from 92% to 88% since 2011 (**Figure 6.2**).

Patterns by background characteristics

- The percentage of currently married women who want no more children or are sterilized increases from 13% among those with one child to 86%–91% among those with three or more children (**Table 6.2** and **Figure 6.3**).
- The desire to limit childbearing varies by division. Fifty-four percent of currently married women in Chattogram do not want to have another child, as compared with 61% in Rajshahi and Khulna.
- The percentage of currently married women who do not want more children decreases as level of education increases. Seventy-nine percent of women with no education want to limit childbearing, compared with 40% of those with a secondary education or higher.
- Women in the poorest households are more inclined to limit childbearing than those in the wealthiest households (62% and 54%, respectively).

Figure 6.3 Desire to limit childbearing by number of living children

Percentage of currently married women age 15–49 who want no more children

6.2 IDEAL NUMBER OF CHILDREN

Ideal number of children

Respondents with no children were asked “If you could choose exactly the number of children to have in your whole life, how many would that be?”

Respondents who had children were asked “If you could go back to the time when you did not have any children and could choose exactly the number of children to have in your whole life, how many would that be?”

Sample: Women age 15–49

The mean ideal number of children is 2.3 among both currently married and ever-married women in Bangladesh (**Figure 6.4**). On average, respondents with more children tend to report a higher number of children as being ideal. Ever-married women who have no children consider 2.1 children to be ideal, while those with six or more children consider 3.6 children to be ideal (**Table 6.3**).

Trends: The mean ideal number of children among ever-married women decreased from 2.4 in 2004 to 2.2 in 2014 before increasing slightly to 2.3 in 2022.

Patterns by background characteristics

- Mean ideal number of children generally increases with age, from 2.1 children among women age 15–19 to 2.6 children among women age 45–49 (**Table 6.4**).
- The mean ideal number of children varies slightly by division, ranging from 2.1 in Khulna to 2.5 in Sylhet and Chattogram.
- Women with no education tend to report a higher number of children as being ideal than women with a secondary education or higher (2.5 versus 2.2) (**Figure 6.5**).
- The mean ideal number of children is higher among women from households in the lowest wealth quintile than among women from households in the highest wealth quintile (2.4 versus 2.2).

6.3 FERTILITY PLANNING STATUS

Planning status of births/pregnancies

Women reported whether their births/pregnancies were wanted at the time (planned birth), at a later time (mistimed birth), or not at all (unwanted birth).

Sample: Current pregnancies and live births in the 3 years before the survey among women age 15–49 and all pregnancy outcomes in the 3 years before the survey among women age 15–49

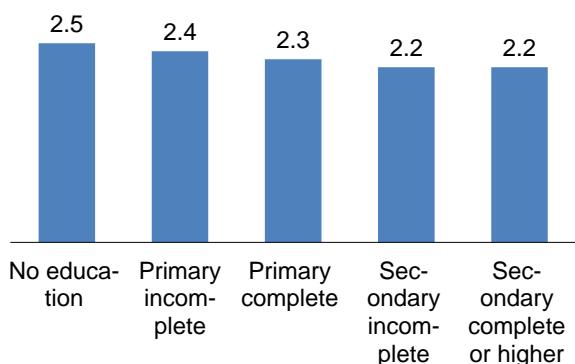

Figure 6.4 Ideal number of children

Mean ideal number of children among women age 15–49

Figure 6.5 Ideal number of children by education

Mean ideal number of children

Eighty-one percent of current pregnancies and live births in the 3 years preceding the survey were wanted at the time of conception, while 12% were mistimed and 7% were unwanted (**Table 6.5** and **Figure 6.6**).

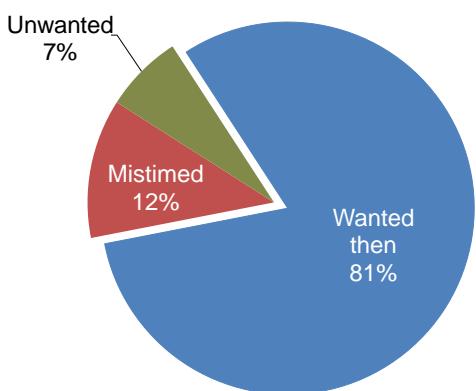

Trends: In Bangladesh, there has been a steady increase in pregnancy planning. Planned births increased from 69% in 2004 to 71% in 2011, 74% in 2014, and 81% in 2022.

Patterns by background characteristics

- The percentage of unwanted births rises with birth order. Less than 1% of first-order births are unwanted, as compared with 36% of fourth- or higher-order births (**Table 6.5**).
- Similarly, the proportion of unwanted births increases with mother's age, from less than 1% among women age 15–19 to 33% among women age 35–39.
- The proportion of births that are mistimed decreases as the mother's age increases, declining from 15% among women under age 20 to 4% among women age 35–39.
- The percentage of desired births is higher for stillbirths (83%) than for miscarriages (71%). The percentage of unwanted births is highest for abortions and miscarriages (53% and 15%, respectively) (**Figure 6.7**).

Figure 6.6 Fertility planning status

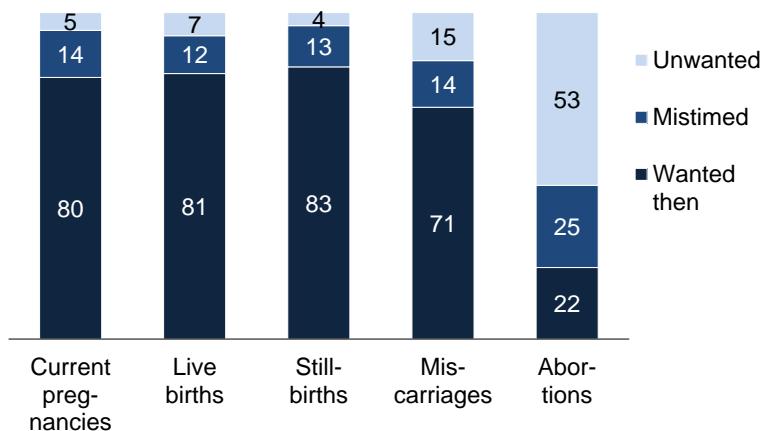

Percent distribution of pregnancy outcomes among women age 15–49 in the 3 years before the survey by planning status of pregnancy

Note: Pregnancy outcome = miscarriage, abortion, live birth, or stillbirth.

Figure 6.7 Fertility planning status by pregnancy outcome

Percent distribution of pregnancy outcomes among women age 15–49 in the three years before the survey by planning status of pregnancy

Note: Some columns may not add to 100% due to rounding.

6.4 WANTED FERTILITY RATES

Unwanted birth

Any birth in excess of the number of children a woman reported as her ideal number.

Wanted birth

Any birth less than or equal to the number of children a woman reported as her ideal number.

Wanted fertility rate

The average number of children a woman would have by the end of her childbearing years if she bore children at the current age-specific fertility rates, excluding unwanted births.

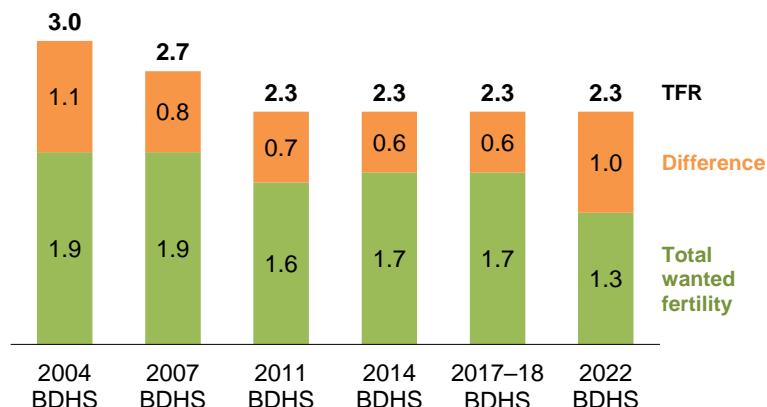

Sample: Women age 15–49

The total wanted fertility rate in Bangladesh is 1.3 children, while the actual total fertility rate (TFR) is 2.3 children. This implies that, on average, Bangladeshi women have 1.0 child more than they want (**Table 6.6**).

Trends: The total wanted fertility rate in Bangladesh decreased from 1.9 children in 2004 and 2007 to 1.3 children in 2022. The gap between wanted and actual fertility decreased slightly from 1.1 children in 2004 to 0.6 in 2017–18 before increasing to 1.0 in 2022 (**Figure 6.8**).

Figure 6.8 Trends in wanted and actual fertility

Wanted and actual number of children per woman

Patterns by background characteristics

- The gap between actual and wanted fertility is slightly larger among women who live in rural areas (1.1 children) than among women who live in urban areas (0.9 children) (**Table 6.6**).
- The gap between actual and wanted fertility decreases from 1.3 children among women with no education to 1.1 children among women with a secondary education or higher.
- Similarly, the gap between actual and wanted fertility declines from 1.5 children among women from households in the lowest wealth quintile to 0.9 children among those from households in the highest wealth quintile.

6.5 SPOUSAL AGREEMENT REGARDING DESIRED NUMBER OF CHILDREN

Overall, 88% of currently married women report that their husband wants the same number of children as they do. Six percent of women say that their husband wants more children than they do, and 3% say that their husband wants fewer children (**Table 6.7**). Spousal agreement on desired number of children has increased by 9 percentage points since 2017–18.

Patterns by background characteristics

- The percentage of women reporting that their husband wants the same number of children as they do is slightly higher in urban areas (89%) than in rural areas (87%).
- There are small variations in the level of spousal agreement on desired number of children across administrative divisions. Mymensingh has the highest agreement (90%), while Sylhet and Rajshahi are lowest (85%).
- The proportion of women who say that their husband wants the same number of children as they do increases from 86% among those with no education to 89% among those with a secondary education or higher.
- Spousal agreement on desired number of children is higher among women from households in the highest wealth quintile (88%) than among those from households in the lowest quintile (87%).

LIST OF TABLES

For more information on fertility preferences, see the following tables:

Pregnancy outcome type					
Current pregnancies	80.1	14.4	5.4	100.0 1,181	
Live births	81.4	11.6	7.1	100.0 5,406	
Stillbirths	83.4	12.6	4.0	100.0 123	
Miscarriages	71.1	14.3	14.7	100.0 681	
Abortions	21.9	25.2	52.9	100.0 171	
Total	78.9	12.6	8.5	100.0 7,562	

Note: Pregnancy outcome refers to a miscarriage, abortion, live birth, or stillbirth. Some pregnancies produce multiple outcomes, for example in the case of twins. In this table, each pregnancy outcome is counted individually. Therefore, a pregnancy is counted more than once if it produces multiple births (live births or stillbirths). Current pregnancies, miscarriages, and abortions are always counted as one pregnancy outcome. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ For pregnancies that resulted in multiple outcomes (for example, twins), each outcome is counted individually.

² For current pregnancies, the maternal age at birth is estimated as the mother's expected age at the time of the birth.

Table 6.6 Wanted fertility rates

Note: Nonsterilized women refers to couples in which neither the wife nor the husband is sterilized.

FAMILY PLANNING

Key Findings

- **Contraceptive prevalence:** Contraceptive prevalence is 64% among currently married women age 15–49; 55% of women are using modern methods of contraception, and 9% rely on traditional methods. Contraceptive prevalence increased from 45% in 1993–94 to 64% in 2022. The pill is by far the most widely used method (27%), followed by injectables (11%).
- **Modern contraceptive use:** Between 2017–18 and 2022, use of modern contraceptive methods increased from 52% to 55%.
- **Sources of modern methods:** The majority of users of modern contraceptive methods obtained their method from the private medical sector (57%), followed by the public sector (37%).
- **Contraceptive discontinuation:** 32% of episodes of contraceptive use experienced in the 5 years preceding the survey were discontinued within 12 months. The most common reason for contraceptive discontinuation was the desire to become pregnant (36%), followed by side effects and health concerns (20%).
- **Demand for family planning:** Total demand for family planning in Bangladesh is 74%, remaining steady since 2017–18 (75%).
- **Unmet need for family planning:** Overall, 10% of currently married women in Bangladesh have an unmet need for family planning services, 5% each for spacing and for limiting. While demand for family planning has remained steady, unmet need decreased from 12% in 2017–18 to 10% in 2022.

Couples can use contraceptive methods to limit or space the number of children they have. This chapter presents information on the prevalence and sources of contraceptive methods as well as rates of and reasons for contraceptive discontinuation. It also examines potential demand for family planning and the level of contact nonusers have with family planning providers.

The 4th Health, Population and Nutrition Sector Program (HPNSP) 2017–22 aimed to increase contraceptive prevalence from 62% to 75% by 2022, with an emphasis on increasing the use of modern methods in lagging divisions (Sylhet and Chattogram). In alignment with the 4th HPNSP, Bangladesh's Family Planning 2020 (FP2020) program was updated to include a commitment to increasing the use of long-acting and permanent methods from 8% to 20%, reducing unmet need for family planning from 12% to 10%, and reducing the contraceptive discontinuation rate from 30% to 20% by 2021 (Government of Bangladesh 2017).

7.1 CONTRACEPTIVE USE

Use of family planning helps women avoid unintended and unplanned pregnancies and reduces the risk of unsafe abortions. Contraceptives also help women space the births of their children, which directly benefits the health of both the mother and the infant.

Contraceptive prevalence

Percentage of women who use any contraceptive method.

Sample: Currently married women age 15–49

Modern methods

Include male and female sterilization, intrauterine devices (IUDs), injectables, implants, contraceptive pills, male and female condoms, emergency contraception, the standard days method, and the lactational amenorrhea method

The prevalence of contraceptive use among currently married women age 15–49 is 64%; 55% of women are using modern contraceptive methods, and 9% are using traditional methods (**Table 7.1.1**).

In Bangladesh, the pill is by far the most widely used method (27%), followed by injectables (11%). Only 8% of currently married women use a long-acting or permanent method such as female or male sterilization, implants, or IUDs (**Figure 7.1**). Among currently married women using traditional methods, the most common method is the rhythm method (6%). Thirty-six percent of currently married women are not using a contraceptive method (**Table 7.1.1**).

Trends: Contraceptive prevalence increased by nearly 20 percentage points between 1993–94 and 2022 (from 45% to 64%). There have been only minimal changes over the past 11 years in the percentage of women using modern contraceptive methods (52% in 2011, 54% in 2014, 52% in 2017–18, and 55% in 2022) (**Table 7.1.2** and **Figure 7.2**).

Patterns by background characteristics

- The use of modern methods is highest among women age 30–34 and age 35–39 (63% each). With respect to overall use, the pill is the most widely used method among all age groups (**Table 7.1.1**).
- The use of contraceptive methods is more prevalent among currently married women who have three or four living children (73%) than among women with no children (27%) (**Table 7.1.3**).
- Use of any contraceptive method is higher among currently married women in urban areas than in rural areas (67% versus 63%). Similarly, use of male condoms is more common in urban areas (13%) than in rural areas (6%) (**Table 7.1.3**).

Figure 7.1 Contraceptive use

Percentage of currently married women age 15–49 currently using a contraceptive method

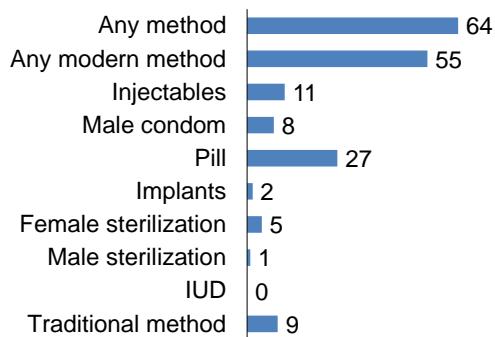

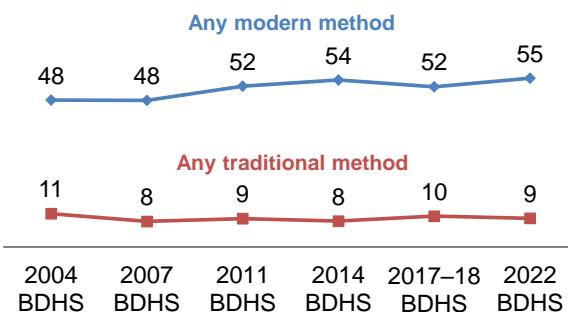

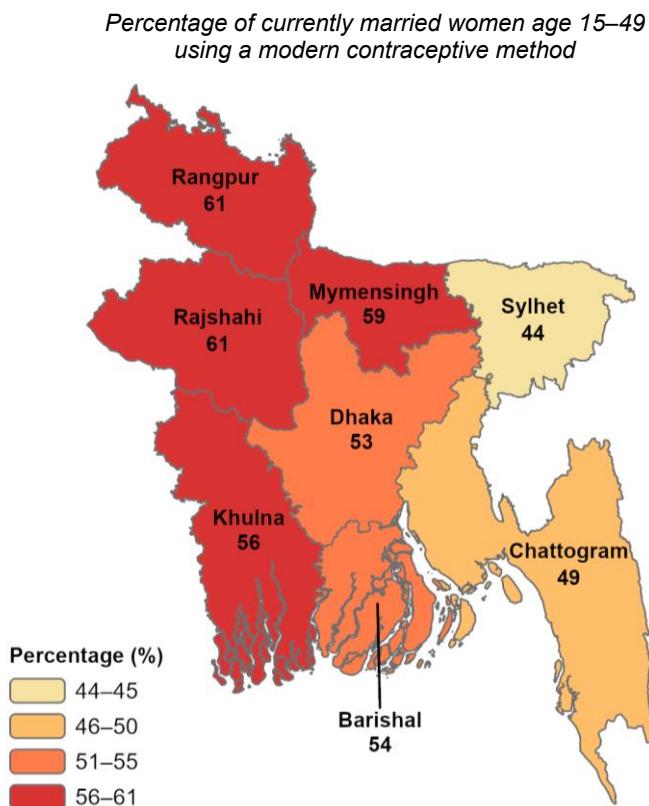

Figure 7.2 Trends in contraceptive use

Percentage of currently married women currently using a contraceptive method

- By division, use of modern methods is highest in Rajshahi and Rangpur (61% each) and lowest in Sylhet (44%) and Chattogram (49%) (**Map 7.1**). The 4th HPNSP aimed to increase the prevalence of modern contraceptive use to 60% in Chattogram and Sylhet by 2022 (MoHFW 2017a).

Map 7.1 Modern contraceptive use by division

- In general, the use of modern contraceptive methods decreases with increasing household wealth. Sixty-one percent of women in the lowest wealth quintile use a modern method, as compared with 48% of women in the highest quintile. The two most common methods—pills and injectables—follow the same pattern; however, condom use and use of traditional methods increase as household wealth increases (**Figure 7.3**).

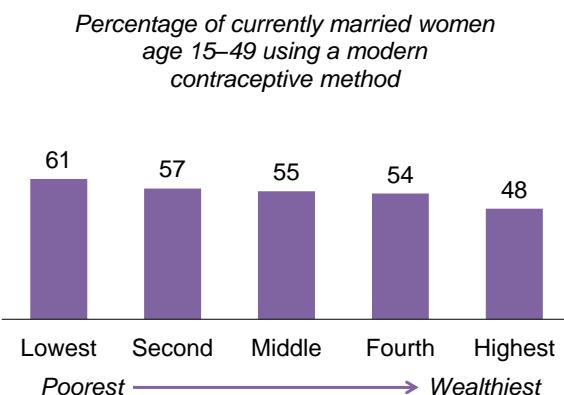

7.1.1 Timing of Female Sterilization

Women who use sterilization generally undergo the procedure early in their reproductive years. About 32% of sterilized women had the procedure at age 30–34, 30% at age 25–29, and 17% before age 25. The median age at sterilization is 30.0 years (**Table 7.2**).

7.1.2 Use of Emergency Contraception

Overall, use of emergency contraception is low in Bangladesh. Only 2% of ever-married women used this method in the past 12 months. Use of emergency contraception is slightly higher among younger women in the 15–19 and 20–24 age groups (3% each). Urban women use emergency contraception at a higher rate than rural women (2% versus 1%). Use of emergency contraception generally increases with increasing

Figure 7.3 Use of modern methods by household wealth

education. One percent of women with no education have used emergency contraception, as compared with 3% of women with a secondary education or higher (**Table 7.3**).

7.2 SOURCE OF MODERN CONTRACEPTIVE METHODS

Source of modern contraceptives

The place where the modern method currently being used was obtained the last time it was acquired.

Sample: Women age 15–49 currently using a modern contraceptive method

Most users of modern contraceptive methods obtained their method from the private medical sector (57%), while 37% obtained it from the public sector. Three percent obtained their method from a nongovernmental organization (NGO) and 4% from other sources (**Table 7.4** and **Figure 7.4**).

The source of modern contraceptive methods varies depending on the method used. Long-acting or permanent methods such as sterilization, implants, and IUDs are usually obtained from public sector facilities, particularly upazila health complexes and union health and family welfare centers. Interestingly, most female sterilizations are performed in private clinics (35%), while male sterilization is mostly performed in upazila health complexes (46%) (**Table 7.4**).

The 2022 BDHS asked women who have never used family planning whether they know a source of family planning services. Fifty-six percent each of women reported that they know a public sector source and a private medical sector source, while only 4% know an NGO source and 6% know another source (**Table 7.5**).

Use of Social Marketing Brand Pills and Condoms

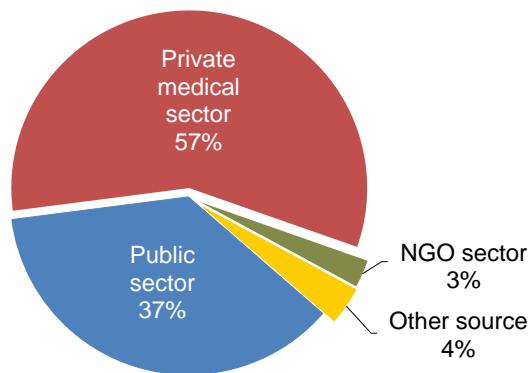

Bangladesh has an active social marketing program that distributes family planning methods including pills, condoms, injectables, IUDs, and implants as well as other health and nutrition products. These items are distributed through a network of retail outlets such as pharmacies, small shops, kiosks, nongraduate private health providers (Blue Star, Green Star), graduate health providers (Pink Star), and NGOs. The Social Marketing Company (SMC) currently carries several brands of oral contraceptive pills, including Femicon, Femipil, Nordette-28, and the progestin-only pill Minicon (SMC 2018).

As shown in **Table 7.6**, 40% of pill users use the government-supplied brand, Shuki, and 39% use Femicon. Among condom users, 35% use Panther, 17% use Hero, and 9% use Raja.

Among users of the male condom, the percentage who use Panther is similar in urban and rural areas (35% and 34%, respectively). The government-supplied brand, Nirapad, is used more frequently in rural areas (19%) than in urban areas (10%) (**Table 7.7**).

Figure 7.4 Source of modern contraceptive methods

Percent distribution of current users of modern methods age 15–49 by most recent source of method

7.3 DISCONTINUATION OF CONTRACEPTIVES

Contraceptive discontinuation rate

Percentage of contraceptive use episodes discontinued within 12 months.

Sample: Episodes of contraceptive use in the 5 years before the survey experienced by women who are currently age 15–49 (one woman may contribute more than one episode)

Thirty-two percent of episodes of contraceptive use are discontinued within 12 months (**Table 7.8**).

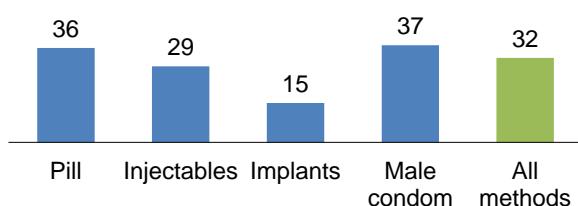

Discontinuation rates are higher for temporary methods such as male condoms (37%), pills (36%), and withdrawal (33%) than for long-term methods such as implants (15%) (**Figure 7.5**).

The most common reason for discontinuation is the desire to become pregnant (36%), followed by side effects and health concerns (20%). Only 12% of women reported becoming pregnant while using as the reason for method discontinuation (**Table 7.9**).

7.4 DEMAND FOR FAMILY PLANNING

Figure 7.5 Contraceptive discontinuation rates

Percentage of contraceptive episodes discontinued within 12 months

Unmet need for family planning

Percentage of women who:

- (1) are not pregnant and not postpartum amenorrheic and are considered fecund and want to postpone their next birth for 2 or more years or stop childbearing altogether but are not using a contraceptive method, or
- (2) have a mistimed or unwanted current pregnancy, or
- (3) are postpartum amenorrheic and their most recent birth in the past 2 years was mistimed or unwanted.

Met need for family planning

Current contraceptive use (any method)

Sample: Currently married women age 15–49

Demand for family planning: Unmet need for family planning + met need (current contraceptive use [any method])

Proportion of demand satisfied: $\frac{\text{Current contraceptive use (any method)}}{\text{Unmet need} + \text{current contraceptive use (any method)}}$

Proportion of demand satisfied by modern methods: $\frac{\text{Current contraceptive use (any modern method)}}{\text{Unmet need} + \text{current contraceptive use (any method)}}$

The total demand for family planning in Bangladesh is 74%. Overall, 10% of currently married women in Bangladesh have an unmet need for family planning services, 5% each for spacing and for limiting (Table 7.10 and Figure 7.6).

Trends: Unmet need for family planning in Bangladesh decreased from 14% in 2011 to 12% in 2014 and 2017–18 and 10% in 2022. Total demand for family planning remained almost constant over the same period (75% in 2011 and 74% in 2022) (Figure 7.7).

Patterns by background characteristics

- Unmet need for family planning decreases with increasing age, from 13% among women age 15–19 to 4% among women age 45–49 (Table 7.10).
- Unmet need generally increases with increasing household wealth; 8% of women in the lowest wealth quintile have an unmet need for family planning, as compared with 12% of women in the highest wealth quintile (Figure 7.8).
- Similarly, unmet need generally increases with increasing education; 6% of women with no education have an unmet need for family planning, compared with 12% of women with an incomplete secondary education (Table 7.10).
- Among the eight divisions, unmet need is highest in Chattogram (16%) and Sylhet (13%) and lowest in Rajshahi (6%) (Map 7.2).

with unmet need for family planning*

7.5 DECISION MAKING ABOUT FAMILY PLANNING AND OPINION ABOUT USING FAMILY PLANNING

The 2022 BDHS collected information from currently married women regarding decision making about family planning. Eighty percent of currently married women reported that they made the decision to use family planning methods jointly with their husband, with 70% saying that their opinion and the opinion of their husband were equally important. Eleven percent of women said that they made their own decision and 8% reported that their husband mainly made the decision (Table 7.11). Overall, 91% of women participate (either alone or jointly) in decision making about family planning (Table 7.12).

7.6 PRESSURE TO BECOME PREGNANT

Overall, 3% of currently married women age 15–49 reported that they had ever been pressured to become pregnant by their husband or other family member. Women with no children reported being pressured to become pregnant at a higher rate (5%) than those with one or more children (2%–3%). Younger women in the 15–19 and 20–24 age groups more often reported feeling pressured to become pregnant (6% and 4%, respectively) than those in older age groups (Table 7.13).

7.7 FUTURE USE OF CONTRACEPTION

Thirty-four percent of currently married women age 15–49 who are not currently using a contraceptive method reported that they intend to use contraception in the next 12 months, while 60% do not intend to use contraception and 5% are unsure. Intention to use contraception in the next 12 months is lowest among women with four or more children (19%) and highest among those with one child (43%) (Table 7.14).

The 2022 BDHS survey assessed preferred contraceptive methods among currently married women who are not using contraception but say that they intend to use a method in the next 12 months. Fifty-five percent of prospective users reported they would prefer to use the pill, while 17% would prefer to use

injectables. Thirteen percent of currently married women reported that they were not sure what method they wanted to use (**Table 7.15**).

Reasons for Not Intending to Use Contraception

Table 7.16 shows the main reasons women who are not using a contraceptive method do not intend to use one in the next 12 months. The most cited reasons were that women were not having sex (27%) and menopause or hysterectomy (20%). Ten percent of women do not intend to use contraception because they want as many children as possible. Two percent each of women cited health concerns and fear of side effects as the reason why they do not intend to use contraception in the next 12 months.

7.8 EXPOSURE TO FAMILY PLANNING MESSAGES

To assess the reach of family planning messages, the 2022 BDHS asked women whether they had heard or seen a message about family planning on the radio or television, in a newspaper or magazine, on a mobile phone, or in other media sources (e.g., billboard, poster, or leaflet; social media/internet; or community event) in the 12 months before the survey. Outdoor signs and billboards are the most common source of family planning messages (26%), followed by television (20%); posters, leaflets, and brochures (13%); and social media (9%). Sixty percent of women reported that they had no exposure to family planning messages through any of eight specified sources (**Table 7.17**).

7.9 CONTACT WITH FIELDWORKERS

Contact of nonusers with family planning providers

Respondent discussed family planning in the 12 months before the survey with a fieldworker.

Sample: Women age 15–49

In the 2022 BDHS, women were asked whether a fieldworker had visited them in the 6 months prior to the survey. **Table 7.18** shows that 17% of currently married women reported a visit by a fieldworker in the past 6 months. Among them, 60% discussed family planning with the fieldworker, 23% received a family planning method, and 17% both discussed family planning and received a family planning method from the fieldworker.

Among those who were visited by a fieldworker, 60% were visited by a government family planning fieldworker, 28% by a government health fieldworker, and 13% by an NGO fieldworker (**Table 7.19**). It should be noted that family planning fieldworkers and health fieldworkers are government fieldworkers working under different directorates, the family planning directorate and the health directorate.

Patterns by background characteristics

- Visits from fieldworkers are more common in rural areas than in urban areas. Nineteen percent of women in rural areas reported a visit by a fieldworker, as compared with 12% of women in urban areas (**Table 7.18**).
- Fieldworkers visit women in the lowest wealth quintile more frequently than those in the highest wealth quintile (20% versus 11%).

7.10 POSTPARTUM COUNSELING AND FAMILY PLANNING

Among ever-married women age 15–49 who gave birth in a health facility in the 2 years before the survey and received postnatal care, 78% received counseling about exclusive breastfeeding, 71% received information on family planning methods, 61% received information on sources of family planning methods, and 58% received information on the importance of spacing and limiting births. Regarding other

types of counseling, 35% and 34% of women received information on immediate IUD and implant insertion, respectively; 29% on immediate tubal ligation; and 19% on the use of the lactational amenorrhea method (LAM) (**Table 7.20**).

Other ⁷	(2.8)	(1.3)	(1.0)	(0.5)	(8.6)	(4.6)	(0.0)	(0.6)	(0.0)	(19.4)	(12.5)	173
All methods	3.3	8.9	6.7	0.7	7.2	2.6	1.5	0.9	0.5	32.2	9.4	14,003

Note: Figures are based on life table calculations using information on episodes of use that occurred 3–62 months preceding the survey. Figures in parentheses are based on 25–49 unweighted cases.

¹ Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation

² Includes lack of access/too far, costs too much, and inconvenient to use

³ Includes up to God/fatalistic and other reasons

⁴ Reasons for discontinuation are mutually exclusive and add to the total in this column.

⁵ A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave “wanted a more effective method” as the reason for discontinuation and started another method within 2 months of discontinuation.

⁶ All episodes of use that occurred in the 5 years preceding the survey are included. Episodes of use include both episodes that were discontinued during the period of observation and episodes that were not discontinued during the period of observation.

⁷ Includes lactational amenorrhea method (LAM), male sterilization, IUD, emergency contraception, standard days method (SDM), female condom, and other methods

Table 7.9 Reasons for discontinuation

Percent distribution of discontinuations of contraceptive methods in the 5 years preceding the survey by main reason stated for discontinuation, according to method, Bangladesh DHS 2022

Reason	IUD	Injectables	Implants	Pill	Male condom	Rhythm	Withdrawal	Other ¹	All methods
Became pregnant while using	1.0	6.2	1.1	13.8	12.5	17.6	21.5	(28.8)	12.3

LAM = lactational amenorrhea method

INFANT AND CHILD MORTALITY

Key Findings

- **Current levels:** The under-5 mortality rate for the 3 years preceding the survey was 31 deaths per 1,000 live births. The infant mortality rate was 25 deaths per 1,000 live births, and the child mortality rate was 6 deaths per 1,000 children. The neonatal mortality rate was 20 deaths per 1,000 live births, and these deaths accounted for 65% of all under-5 deaths. Under-5-mortality, infant mortality, and neonatal mortality rates have declined gradually over the past three decades.
- **Perinatal mortality:** The perinatal mortality rate is 38 deaths per 1,000 pregnancies of 28 or more weeks' duration. Stillbirths account for more than half of perinatal mortality.
- **High-risk fertility behavior:** 60% of currently married women would have been in an avoidable high-risk category if they had conceived at the time of the survey.

Information on infant and child mortality is relevant to a demographic assessment of a country's population and is an important indicator of the country's socioeconomic development and people's quality of life. It can also help identify children who may be at higher risk of death and lead to strategies to reduce this risk, such as promoting birth spacing.

This chapter presents information on levels, trends, and differentials in perinatal, neonatal, infant, and under-5 mortality rates. It also examines biodemographic factors and fertility behaviors that increase mortality risks for infants and children. The information was collected as part of a retrospective pregnancy history in which female respondents listed all of the children to whom they have given birth, along with each child's date of birth, survivorship status, and current age or age at death.

In the 2022 BDHS, changes were made in the reporting of infant and child mortality data. In the 2017–18 BDHS, national mortality rates were calculated based on a 5-year recall period, roughly spanning 2012–18, and were approximately centered on 2015. The 2022 BDHS adopted a 3-year recall period for national mortality rates with estimates centering on 2021, thereby providing more up-to-date information. However, mortality rates disaggregated by background characteristics are still presented for the 5 years preceding the survey. Trend analyses use the 3-year childhood mortality rates from the eight previous BDHS surveys.

The quality of mortality estimates calculated from pregnancy histories depends on the mother's ability to recall all of the children she has given birth to, as well as their birth dates and ages at death. Potential data quality problems include:

- The selective omission from pregnancy histories of those births that did not survive, which can result in underestimation of childhood mortality.
- Displacement of birth dates, which could distort mortality trends. This can occur if an interviewer knowingly records a birth as occurring in a different year than the one in which it occurred. This could happen if an interviewer is trying to cut down on his or her overall workload, because live births occurring in the 3 years before the interview are subject to a lengthy set of additional questions.

- Misreporting the child's age at death which may distort the age pattern of mortality, especially if the net effect of the age misreporting is to transfer deaths from one age bracket to another.
- Any method of measuring childhood mortality that relies on mothers' reports (for example, pregnancy histories) assumes that female adult mortality is not high or, if it is high, that there is little or no correlation between the mortality risks of mothers and those of their children.

Selected indicators of the quality of the infant and child mortality data on which estimates in this chapter are based are presented in Appendix C, **Tables C.5** and **C.6**.

8.1 INFANT AND CHILD MORTALITY

Neonatal mortality: The probability of dying within the first month of life.

Postneonatal mortality: The probability of dying between the first month of life and the first birthday (computed as the difference between infant and neonatal mortality).

Infant mortality: The probability of dying between birth and the first birthday.

Child mortality: The probability of dying between the first and the fifth birthday.

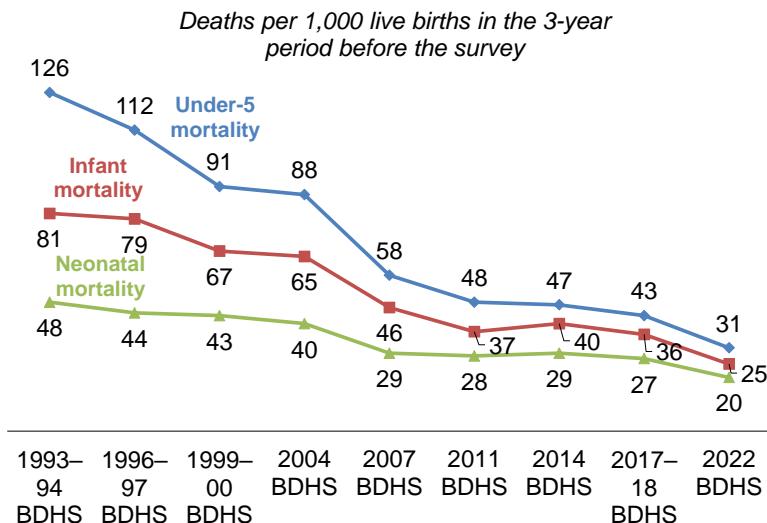

Under-5 mortality: The probability of dying between birth and the fifth birthday.

During the 3 years preceding the survey, the neonatal mortality rate was 20 deaths per 1,000 live births, the infant mortality rate was 25 deaths per 1,000 live births, and the under-5 mortality rate was 31 deaths per 1,000 live births (**Table 8.1**). Neonatal deaths account for four-fifths of infant deaths in Bangladesh. However, the country has already achieved the goal set by the 4th Health, Population and Nutrition Sector Program (HPNSP) of reducing under-5 mortality rate to 34 per 1,000 live births by 2023.

Bangladesh is also on track to achieve the 4th HPNSP's goal of reducing neonatal mortality to 18 per 1,000 live births by 2023.

Figure 8.1 shows trends in under-5, infant, and neonatal mortality rates over time based on estimates for the 3-year period before each survey. Note that in the figure, while the estimates are aligned with the survey years, they should be interpreted as representing the 3 years preceding the survey. Thus, for example, the 2022 mortality rates reflect estimates for 2019–22, centering around 2021.

Figure 8.1 Trends in early childhood mortality rates

Trends: All indicators related to childhood mortality have declined over the past three decades. Between 1993–94 and 2022, under-5, infant, and neonatal mortality rates dropped by 75%, 69%, and 58%, respectively. However, declines were notably slow or absent between 2011 and 2017–18 (**Figure 8.1**).

Attaining the aim of the SDG target will require additional efforts, namely achieving a further 19% reduction in under-5 mortality (from 31 to 25 deaths per 1,000 live births) and a further 40% reduction in neonatal mortality (from 20 to 12 deaths per 1,000 live births) by 2030.

Patterns by background characteristics

- Infant and child mortality is higher for boys than for girls. The neonatal mortality rate for the 5-year period preceding the survey is higher among male children than female children (26 versus 19 deaths per 1,000 live births). Likewise, under-5 mortality is 35 deaths per 1,000 live births among male children, as compared with 30 deaths per 1,000 live births among female children (**Table 8.2**).
- The infant mortality rate is the same in urban and rural areas (27 deaths per 1,000 live births). Under-5 mortality is slightly lower in urban areas than in rural areas (31 versus 33 deaths per 1,000 live births).

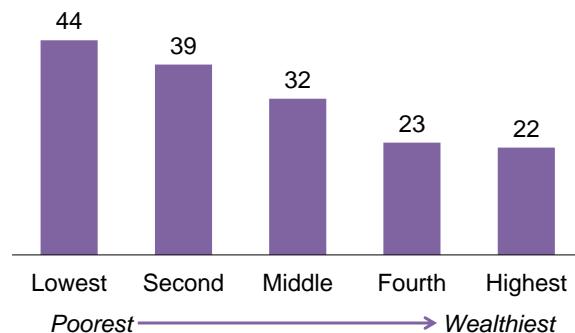

Table 8.3 presents data on the relationship between additional background characteristics and child mortality for the 5-year period preceding the survey.

Patterns by additional background characteristics

- Under-5 mortality varies by division. Sylhet has the highest level of under-5 mortality (52 deaths per 1,000 live births), followed by Rangpur (41 deaths per 1,000 live births), while Khulna has the lowest level (22 deaths per 1,000 live births) (**Table 8.3** and **Map 8.1**).
- Neonatal, infant, and under-5 mortality rates generally decrease with increasing household wealth. For instance, under-5 mortality is 44 deaths per 1,000 live births among children in the lowest wealth quintile, as compared with 22 deaths per 1,000 live births among children in the highest wealth quintile (**Figure 8.2**).

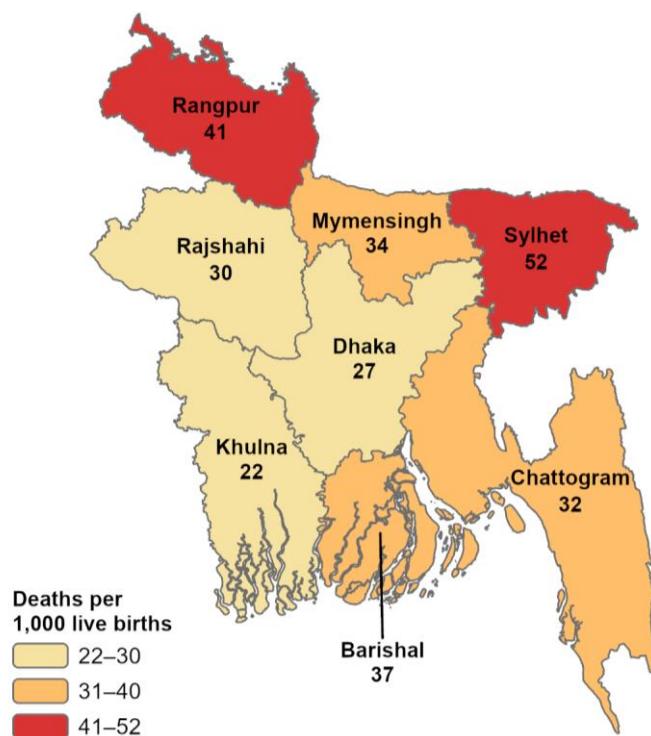

Figure 8.2 Under-5 mortality by household wealth

Deaths per 1,000 live births for the 5-year period before the survey

Map 8.1 Under-5 mortality by division

Deaths per 1,000 live births for the 5-year period before the survey

8.2 PERINATAL MORTALITY

Perinatal mortality rate

Perinatal deaths comprise stillbirths (pregnancy losses occurring after 28 weeks of gestation) and early neonatal deaths (deaths among live births in the first 7 days of life). The perinatal mortality rate is calculated as the number of perinatal deaths per 1,000 pregnancies of 28 or more weeks' duration.

Sample: Number of pregnancies of 28 or more weeks' duration among women age 15–49 in the 3 years before the survey

In 2014 the Every Newborn Action Plan, a global multipartner movement to end preventable maternal and newborn deaths and stillbirths, set a target for national stillbirth rates of 12 or fewer stillbirths per 1,000 births in all countries by 2030 (WHO and UNICEF 2014).

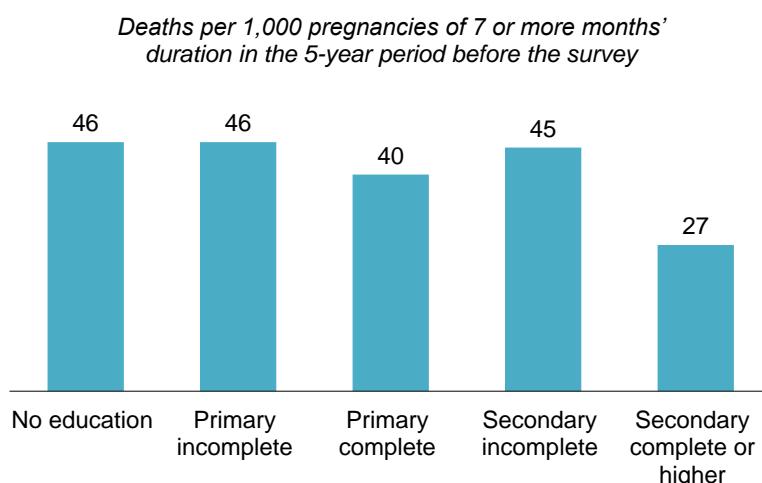

The perinatal mortality rate encompasses both stillbirths and early neonatal deaths. For the 3 years preceding the survey, the stillbirth rate was 21 per 1,000 pregnancies of 28 or more weeks and the early neonatal death rate was 17 per 1,000 live births in. The perinatal mortality rate was 38 deaths per 1,000 pregnancies of 28 or more weeks. Therefore, stillbirths account for more than half (55%) of perinatal mortality (**Table 8.4**).

Trends: The perinatal mortality rate for the 3 years preceding the survey declined from 65 per 1,000 pregnancies for the period 2001–04 to 38 per 1,000 pregnancies of 28 or more weeks for the period 2019–22.

Patterns by background characteristics

- The perinatal mortality rate for the 5 years preceding the survey is highest for women who became pregnant 15–26 months after a previous pregnancy (44 deaths per 1,000 pregnancies of 28 or more weeks) and lowest for women who became pregnant 27–38 months after a previous pregnancy (27 deaths per 1,000 pregnancies of 28 or more weeks) (**Table 8.4**).
- The perinatal mortality rate is higher in rural areas (40 deaths per 1,000 pregnancies of 28 or more weeks) than in urban areas (35 deaths per 1,000 pregnancies of 28 or more weeks).
- By division, perinatal mortality rate ranges from 30 deaths per 1,000 pregnancies of 28 or more weeks in Dhaka to 48 deaths per 1,000 pregnancies of 28 or more weeks in Mymensingh.
- Perinatal mortality decreases as mother's level of education increases. It is higher among mothers who have no education and those who have not completed primary school (46 deaths per 1,000 pregnancies of 28 or more weeks) than among those with a secondary education or higher (27 deaths per 1,000 pregnancies of 28 or more weeks) (**Figure 8.3**).
- The perinatal mortality rate is inversely related to household wealth. It is highest for mothers

Figure 8.3 Perinatal mortality by mother's education

in the lowest wealth quintile (53 deaths per 1,000 pregnancies of 28 or more weeks) and lowest for mothers in the highest wealth quintile (23 deaths per 1,000 pregnancies of 28 or more weeks).

8.3 HIGH-RISK FERTILITY BEHAVIOR

The survival of infants and children depends in part on the demographic and biological characteristics of their mothers. Typically, the probability of dying in infancy is much greater among children born to mothers who are too young (under age 18) or too old (over age 34), children born after a short birth interval (less than 24 months after the preceding birth), and children born to mothers of high parity (more than three children). **Table 8.5** shows the percent distribution of children born in the 5-year period preceding the survey by category of elevated risk of mortality (along with risk ratios) and the percent distribution of currently married women by their category of risk if they were to conceive a child at the time of the survey.

Forty-five percent of births in the 5 years preceding the survey are not in any high-risk category. Twenty-nine percent fall under the unavoidable risk category (first-order births to women between age 18 and age 34) and 27% are in an avoidable high-risk category, with 23% in a single high-risk category and 4% in multiple high-risk categories.

The risk ratio denotes the relationship between risk factors and child mortality. Among the single high-risk categories, the risk ratio is highest (1.56) for births that occur within 24 months of a previous birth. Among the multiple high-risk categories, the risk ratio is highest (1.47) for births in which the mother is over age 34 and the birth order exceeds three.

Sixty percent of currently married women in Bangladesh would have been in an avoidable high-risk category if they had conceived at the time of the survey; 33% would have been in a single high-risk category, and 26% would have been in a multiple high-risk category. Thirty-three percent of women would not have been in any high-risk category, while 8% would have been in an unavoidable risk category (**Table 8.5**).

LIST OF TABLES

For more information on infant and child mortality, see the following tables:

- **Table 8.1 Early childhood mortality rates**

Total (3-year period)	177	138	21	17	38	8,249	1.3

Note: Respondents may choose to report the duration of their pregnancy in either weeks or months.

¹ Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months.

² Early neonatal deaths are deaths at age 0–6 days among live-born children.

³ Stillbirth rate: the number of stillbirths divided by the number of pregnancies lasting 28 or more weeks, expressed per 1,000

⁴ Early neonatal mortality rate: the number of early neonatal deaths divided by the number of live births, expressed per 1,000

⁵ Perinatal mortality rate: the sum of the number of stillbirths and early neonatal deaths divided by the number of pregnancies lasting 28 or more weeks, expressed per 1,000

⁶ Includes pregnancies lasting 7 or more months when duration of pregnancy is reported in months

⁷ Pregnancy interval categories correspond to birth interval categories of <24 months, 24–35 months, 36–47 months, and 48+ months assuming a pregnancy duration of 9 months.

Table 8.5 High-risk fertility behavior

Percent distribution of children born in the 5 years preceding the survey by category of elevated risk of mortality and the risk ratio, and percent distribution of currently married women by category of risk if they were to conceive a child at the time of the survey, Bangladesh DHS 2022

Risk category	Births in the 5 years preceding the survey		Percentage of currently married women ¹
	Percentage of births	Risk ratio

Number of births/women	13,303	na	28,594

Note: Risk ratio is the ratio of the proportion dead among births in a specific high-risk category to the proportion dead among births not in any high-risk category. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

na = not applicable

¹ Women are assigned to risk categories according to the status they would have at the birth of a child if they were to conceive at the time of the survey: current age less than 17 years and 3 months or older than 34 years and 2 months, latest birth less than 15 months ago, or latest birth being of order 3 or higher.

² Includes the category age <18 and birth order >3

^a Includes sterilized women

Key Findings

- **Antenatal care:** The percentage of women receiving antenatal care (ANC) from a medically trained provider has increased gradually over the past three decades, from 21% in 1993–94 to 88% in 2022. Forty-one percent of women had at least four ANC visits for their most recent live birth in the 2 years preceding the survey.
- **Components of antenatal care:** Among women who received ANC for their most recent live birth, only 21% received quality ANC.
- **Protection against neonatal tetanus:** 83% of the most recent live births to women in the 2 years preceding the survey were protected against neonatal tetanus.
- **Delivery services:** 65% of deliveries that resulted in a live birth were conducted in a health facility, and 45% took place in a private medical sector health facility. Overall, 70% of live births were assisted by medically trained providers.
- **Cesarean section:** 45% of live births in the 2 years preceding the survey were delivered via cesarean section, a notable increase from 3% in 1999–2000.
- **Postnatal care:** 55% of mothers and 56% of newborns received a postnatal check during the first 2 days after delivery.
- **Essential newborn care:** The five recommended essential newborn care practices were instituted for only 3% of newborns among noninstitutional deliveries.
- **Problems in accessing health care:** 66% of women reported at least one problem in accessing health care.

Health care services during pregnancy and childbirth and after delivery are important for the survival and well-being of both the mother and the infant. Antenatal care (ANC) can reduce health risks for mothers and infants through monitoring pregnancies and screening for complications. Delivery at a health facility, under skilled medical attention and hygienic conditions, reduces the risk of complications and infections during labor and delivery. Timely postnatal care provides an opportunity to diagnose and treat complications arising from delivery and teach the mother how to care for herself and her newborn after delivery.

The first part of this chapter presents information on ANC coverage, the number and timing of ANC visits, and various components of care. The second focuses on childbirth and provides information on place of delivery, assistance during delivery, and cesarean deliveries. The third section focuses on postnatal care and presents information on postnatal health checks for mothers and newborns as well as newborn care. The final section covers an issue that affects women's health regardless of their maternal status: problems they experience accessing health care.

The Government of Bangladesh is committed to achieving the Sustainable Development Goals of reducing maternal and child mortality and improving access to health care services for all irrespective of

sociodemographic background. The Bangladesh National Strategy for Maternal Health 2019–2030 (MoHFW 2019) aims to guide the government in addressing the existing gaps and inequities in delivery of quality maternal health services as well as the social and development factors that impact maternal health. The government has published the Standard Clinical Management Protocols and Flowcharts on Emergency Obstetric and Neonatal Care (EmONC) to manage labor and common obstetric emergencies in EmONC centers (OGSB and MoHFW 2019). An operational manual for the Maternal and Newborn Health Services Accreditation Program has been developed to maintain minimum standards for maternal and newborn health services in the country's health facilities (DGHS 2022).

9.1 ANTENATAL CARE COVERAGE AND CONTENT

ANC from a medically trained provider is a crucial component of maternal and fetal health care. It involves regular medical check-ups, screenings, and guidance provided to pregnant women. ANC is important to monitor the health of the mother and the developing fetus, to identify potential complications, and to take preventive measures to ensure a safe, healthy pregnancy and delivery. To be most effective, ANC visits/contacts should occur regularly throughout the pregnancy.

9.1.1 Skilled Providers

Antenatal care (ANC) from a medically trained provider

Pregnancy care received from medically trained providers, such as qualified doctors, nurses, midwives, paramedics, family welfare visitors (FWVs), community skilled birth attendants (CSBAs), and sub-assistant community medical officers (SACMOs).

Sample: Women age 15–49 who had a live birth or stillbirth in the 2 years before the survey

Eighty-eight percent of women who had a live birth in the 2 years preceding the survey received ANC from a medically trained provider for their most recent live birth. Among those who had a stillbirth in the 2 years preceding the survey, 77% received ANC for their most recent stillbirth. Eighty-four percent of women who had a live birth in the 2 years preceding the survey received ANC for their most recent live birth from a qualified doctor (**Table 9.1**).

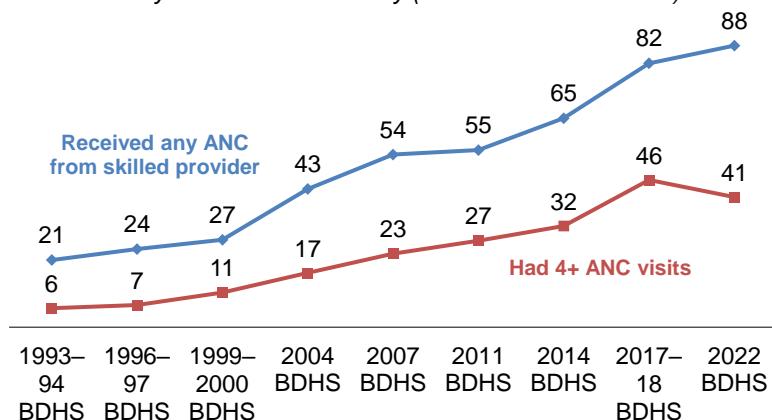

Trends: The proportion of women receiving ANC for their most recent live birth from a medically trained provider has increased fourfold since 1993–94, from 21% to 88% (**Figure 9.1**).

Patterns by background characteristics

- Women with first-order live births (91%) are more likely to receive ANC from a medically trained provider than women with higher-order live births (**Table 9.1**).
- By division, Khulna (91%) has the highest proportion of women receiving ANC from a medically trained provider, whereas Sylhet (80%) has the lowest.

Figure 9.1 Trends in antenatal care coverage

Percentage of women age 15–49 who had a live birth in the 2 years before the survey (for the most recent birth)

- The likelihood of receiving ANC from a medically trained provider increases with increasing education. The proportion of women receiving ANC from a medically trained provider is 73% among those with no education, as compared with 95% among those with a secondary or higher education.
- The likelihood of receiving ANC from a medically trained provider also rises with increasing household wealth, from 76% among women in the lowest wealth quintile to 97% among women in the highest wealth quintile.

9.1.2 Place of Antenatal Care

The place where a woman receives antenatal care has an impact on both frequency and quality of care. Information on source of ANC also assists policymakers with decisions on how to allocate resources. Women who had a live birth in the 2 years preceding the survey were asked whether they received ANC for their most recent birth and where they received it. As women may visit more than one type of facility for ANC during the same pregnancy, the facility categories are not mutually exclusive and do not sum to 100%. The private sector is the leading source for ANC (72%). About one in three women received ANC from public sector health facilities (34%), 4% from nongovernmental organization (NGO) facilities, and 6% at home (**Table 9.2**).

Trends: The proportion of women receiving ANC from the private sector increased from 64% in the 2017–18 BDHS to 72% in the 2022 BDHS, while the proportion of women receiving ANC from the public sector remained nearly the same (36% in the 2017–18 BDHS and 34% in the 2022 BDHS). The proportion of women receiving ANC at home decreased by 30 percentage points between the 2017–18 and 2022 BDHS surveys (from 36% to 6%).

Patterns by background characteristics

- Women with a secondary education or higher (79%) are more likely to receive ANC from the private sector than women with no education (63%).
- Sixty-four percent of women in the lowest wealth quintile received ANC from the private sector, as compared with 79% of women in the highest wealth quintile.

9.1.3 Timing and Number of Antenatal Care Visits

Forty-one percent of women had at least four ANC visits for their most recent live birth in the 2 years preceding the survey; only 5% had eight or more visits. More than one-third of women (37%) received ANC during their first trimester of pregnancy. The median gestational age at the first ANC visit among those who received ANC is 4.7 months. Among women who had a stillbirth in the 2 years preceding the survey, 36% had at least four ANC visits for their most recent stillbirth (**Table 9.3**).

Trends: The proportion of women with at least four ANC visits for their most recent live birth increased from 6% in the 1993–94 BDHS to 46% in the 2017–18 BDHS but declined in the 2022 BDHS (41%) (**Figure 9.1**). The percentage of women receiving ANC during the first trimester increased from 11% in the 1993–94 BDHS to 37% in the 2017–18 BDHS and remained unchanged in the 2022 BDHS.

9.2 COMPONENTS OF ANTENATAL CARE

Components of antenatal care

Specific antenatal care services performed by a health care provider include measuring blood pressure, taking a urine sample, taking a blood sample, measuring weight, and counseling about pregnancy danger signs.

Sample—quality of care indicator: Women age 15–49 who had a live birth or stillbirth in the 2 years before the survey and had at least one ANC visit

Sample—population-based indicator: All women age 15–49 who had a live birth or stillbirth in the 2 years before the survey

The ability for ANC to act as an effective intervention for identifying issues occurring during pregnancy that could adversely affect pregnancy outcomes is dictated in large part by the components of ANC services offered by the health care provider.

As a part of ANC, certain interventions and tests are recommended at each ANC contact. These include but are not limited to the following:

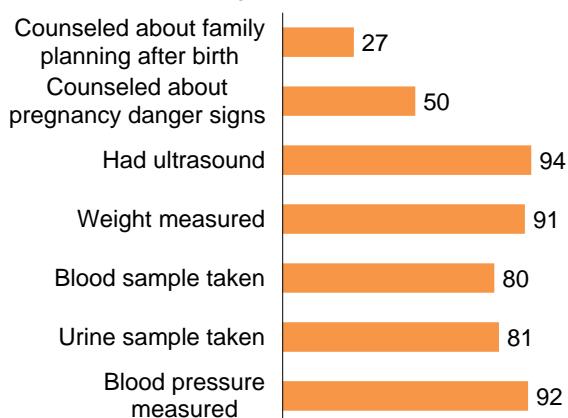

- Measuring blood pressure. Taking a woman’s blood pressure at each antenatal care visit is essential to monitor for gestational hypertension or preeclampsia.
- Conducting urine and blood tests. These tests assess signs of infection or other diseases and conditions that could negatively affect a woman or her baby during or after pregnancy.
- Measuring weight. Measuring a woman’s weight at routine ANC visits helps in understanding gestational weight gain.
- Counseling about pregnancy danger signs. Providing information about pregnancy danger signs is important for helping the woman understand when to go to a health facility so that a health care provider can assess her condition.

In the 2022 BDHS, data collected on components of ANC were tabulated in two ways. **Table 9.4.1** shows the percentage of women with at least one ANC visit for a live birth or stillbirth in the 2 years before the survey who received specified ANC services. This tabulation is a measure of the quality of the ANC services these women received. **Table 9.4.2** shows the percentage of all women with a live birth or stillbirth in the past 2 years who received specified ANC services, regardless of whether they reported an ANC visit. This tabulation is a measure of coverage of these key ANC interventions among the population of women in need of them.

Among women who received ANC for their most recent live birth, 92% had their blood pressure checked, 94% had an ultrasound, and 91% had their weight measured. Urine samples (81%) and blood samples (80%) were taken for four out of five women who received ANC. Only 50% of women received counseling on pregnancy danger signs, and 27% received counseling about family planning after birth (**Table 9.4.1** and **Figure 9.2**).

Figure 9.2 Components of antenatal care

Among women who had a live birth in the 2 years before the survey, percentage receiving selected services

Among all women who had a live birth in the 2 years preceding the survey, 86% had their blood pressure measured, 87% had an ultrasound, and 84% had their weight measured (**Table 9.4.2**).

Patterns by background characteristics

- Among women who received ANC for their most recent live birth, those from urban areas were more likely to have their blood pressure measured (96%), to have a blood sample taken (88%), and to have an ultrasound done (97%) than those from rural areas (91%, 77%, and 93%, respectively) (**Table 9.4.1**).
- Fewer women in the lowest wealth quintile had their blood pressure measured (85%) and an ultrasound done (86%) than women in the highest wealth quintile (98% and 97%, respectively).
- Among all women with a live birth in the 2 years preceding the survey, those with a secondary education or higher were more likely to have their blood pressure measured (94%) and to be counseled about pregnancy danger signs (56%) than those with no education (63% and 31%, respectively) (**Table 9.4.2**).

9.3 QUALITY OF ANTENATAL CARE

The 2022 BDHS defines quality ANC as follows: a woman has four or more ANC visits, of which at least one is with a medically trained provider and receives all five basic components of ANC (weight and blood pressure measurements, urine and blood tests, and counseling on danger signs in pregnancy) at least once. The results showed that 38% of women had four or more ANC visits, at least one with a medically trained provider; an equal proportion of women received all five basic components of ANC. According to the 2022 BDHS definition, only 21% of women with a live birth in the 2 years preceding the survey received quality ANC for their most recent birth (**Table 9.5**).

Patterns by background characteristics

- Urban women receive quality ANC more often than rural women (33% versus 17%) (**Table 9.5**).
- Quality ANC is more common among women with a secondary education or higher (33%) than among women with a primary incomplete education (9%).
- Household wealth appears to be correlated with receipt of quality care. The percentage of women receiving quality ANC ranges from 8% in the lowest wealth quintile to 39% in the highest wealth quintile.

9.4 PROTECTION AGAINST NEONATAL TETANUS

Protection against neonatal tetanus

The number of tetanus toxoid injections needed to protect a baby from neonatal tetanus depends on the mother's vaccinations. A birth is protected against neonatal tetanus if the mother has received any of the following:

- Two tetanus toxoid injections during the pregnancy
- Two or more injections, the last one within 3 years of the birth
- Three or more injections, the last one within 5 years of the birth
- Four or more injections, the last one within 10 years of the birth
- Five or more injections at any time prior to the birth

Sample: Women age 15–49 with a live birth in the 2 years before the survey

Among women age 15–49 with a live birth in the 2 years preceding the survey, 83% had their most recent live birth protected against neonatal tetanus; 25% received two or more injections during the pregnancy (**Table 9.6**).

Patterns by background characteristics

- Mothers age 35–49 are less likely to have received two or more injections during the pregnancy for their most recent live birth (17%) than mothers age 20–34 (22%) and those under age 20 (35%) (**Table 9.6**).
- The percentage of women whose most recent live birth was protected against neonatal tetanus is lowest among those with fourth- or fifth-order births (75%) and highest among those with first-order births (87%).
- By division, the proportion of women whose most recent live birth was protected against neonatal tetanus ranges from 77% in Sylhet division to 87% in Mymensingh division.
- The proportion of women whose most recent live birth was protected against neonatal tetanus is lowest among those with no education (64%) and highest among those with a secondary education or higher (89%).

9.5 DELIVERY SERVICES

Delivery under proper medical attention and hygienic conditions can reduce the risk of complications and infections that can cause death or serious illness for the mother or the newborn. The Bangladesh Maternal Health Strategy, which encourages women to deliver under the care of medically trained birth attendants (TBAs), promotes safe motherhood through various activities, especially delivery by a skilled birth attendant (MoHFW 2019).

9.5.1 Institutional Deliveries

Institutional deliveries

Deliveries that occur in a health facility.

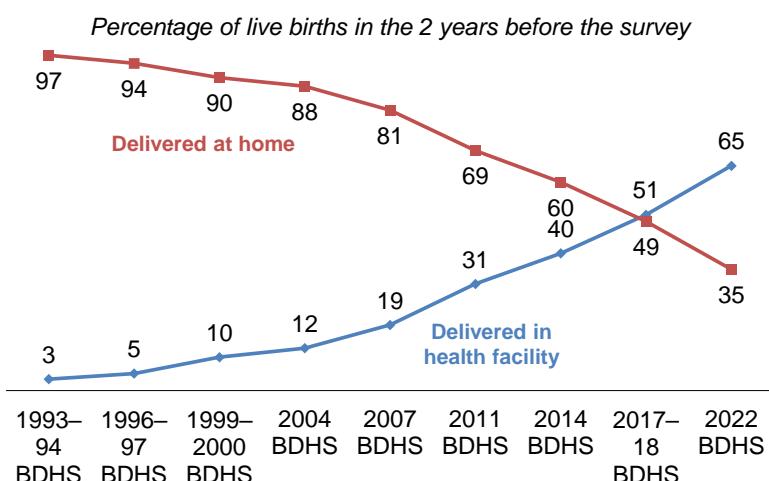

Sample: All live births and/or stillbirths in the 2 years before the survey

Sixty-five percent of live births in the 2 years preceding the survey were delivered in health facilities, while 35% were delivered at home (**Table 9.7**). In the case of stillbirths, 66% were delivered in health facilities and 34% at home.

Eighteen percent of deliveries resulting in a live birth took place in a public sector health facility and 45% in a private medical sector health facility; only 2% occurred in an NGO health facility.

Trends: The proportion of live births delivered in a health facility has increased notably over time, from 3% in the 1993–94 BDHS to 65% in the 2022 BDHS. The proportion of home deliveries decreased from 97% in the 1993–94 BDHS to 35% in the 2022 BDHS (**Figure 9.3**).

Figure 9.3 Trends in place of birth

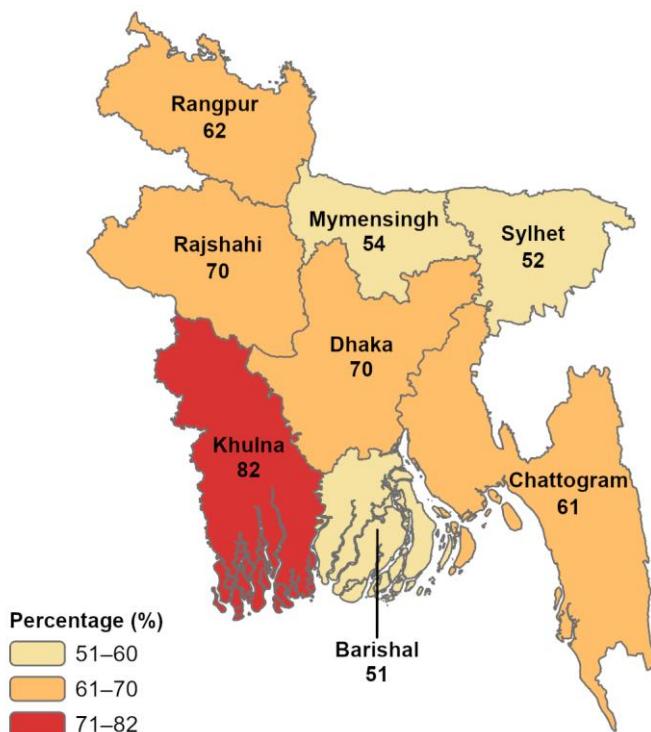

Patterns by background characteristics

- Mothers aged 35–49 deliver live births in a health facility less frequently (55%) than mothers aged 20–34 and those under age 20 (65% each) (**Table 9.7**).
- First-order births are more often (73%) delivered in a health facility than second- or third-order births (63%) and fourth- or fifth-order births (40%).
- Births to mothers who had at least four ANC visits (80%) take place more often in health facilities than births to mothers who had no ANC visits (22%).
- Institutional births are more common in urban areas than rural areas (76% versus 61%).
- By division, the percentage of deliveries that occur in a health facility is highest in Khulna (82%) and lowest in Barishal (51%) (**Map 9.1**).

Map 9.1 Health facility births by division

*Percentage of live births in the 2 years before the survey
that were delivered in a health facility*

- The percentage of institutional births is lower among women with no education (44%) than women with a secondary education or higher (81%).
- Deliveries in a health facility are least common among women in the lowest wealth quintile (42%) and most common among women in the highest wealth quintile (87%) (**Figure 9.4**).

9.5.2 Delivery by Cesarean Section

Access to cesarean sections (C-sections) can reduce maternal and neonatal mortality and complications such as obstetric fistula. However, use of C-sections without medical need can put women at risk of short-term and long-term health problems. The World Health Organization (WHO) advises that C-sections be done when medically necessary but does not recommend a specific rate for countries to achieve at the population level (WHO 2015a). However, the percentage of C-section births is sometimes considered to be a proxy indicator of women's access to skilled care for complicated deliveries.

In the 2022 BDHS, 45% of live births were delivered via C-section in Bangladesh; 21% of stillbirths were delivered via C-section (**Table 9.8**).

Trends: The percentage of live births delivered via C-section increased from 3% in the 1999–2000 BDHS to 45% in the 2022 BDHS.

Patterns by background characteristics

- The C-section rate is higher among first-order live births (51%) than fourth- or fifth-order births (21%) (**Table 9.8**).
- Eighty-three percent of births in private medical sector health facilities are delivered via C-section, as compared with 36% of births in public sector health facilities.
- The C-section rate is higher in urban areas (56%) than in rural areas (40%).
- The C-section rate increases with the mother's level of education. Only 24% of births among mothers with no education are delivered via C-section, compared with 59% of births among mothers with a secondary education or higher.
- C-section deliveries increase with increasing household wealth, from 23% among mothers in the lowest wealth quintile to 67% among mothers in the highest wealth quintile (**Figure 9.5**).

Figure 9.4 Health facility births by household wealth

Percentage of live births in the 2 years before the survey that were delivered in a health facility

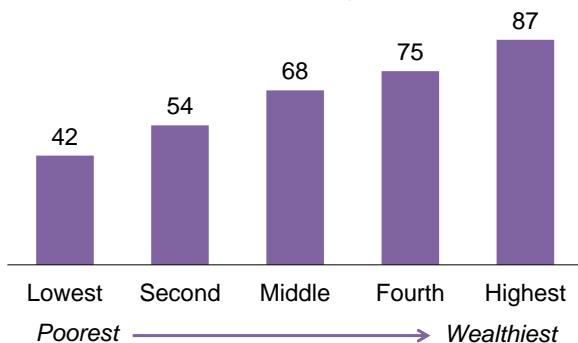

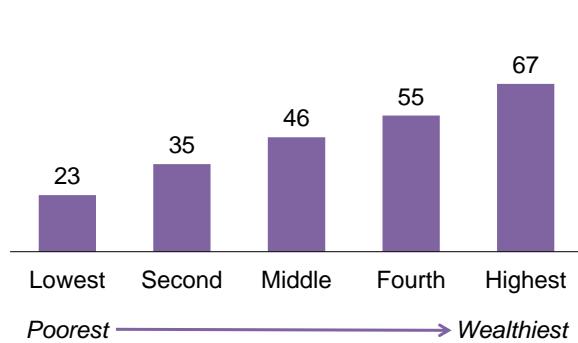

Figure 9.5 Cesarean section by household wealth

Percentage of live births in the 2 years before the survey that were delivered by caesarean section

9.5.3 Skilled Assistance during Delivery

Delivery by a medically trained provider

Births delivered with the assistance of a qualified doctor, nurse, midwife, paramedic, family welfare visitor, community skilled birth attendant, or sub-assistant community medical officer.

Sample: All live births and/or stillbirths in the 2 years before the survey

Obstetric care from a medically trained provider during delivery is a critical factor in reducing maternal and neonatal mortality. The aim of the 4th HPNSP was to increase the percentage of deliveries by medically trained providers to 65% by 2023. The results of the 2022 BDHS suggest that Bangladesh has surpassed this goal. Seventy percent of deliveries resulting in a live birth in Bangladesh were assisted by a medically trained provider, with 56% assisted by a qualified doctor and 13% by a nurse, midwife, or paramedic (**Figure 9.6**). Seventy-three percent of deliveries resulting in a stillbirth were assisted by a medically trained provider. Among most recent live births in the 2 years preceding the survey, 17% had skin-to-skin contact immediately after birth (**Table 9.9**).

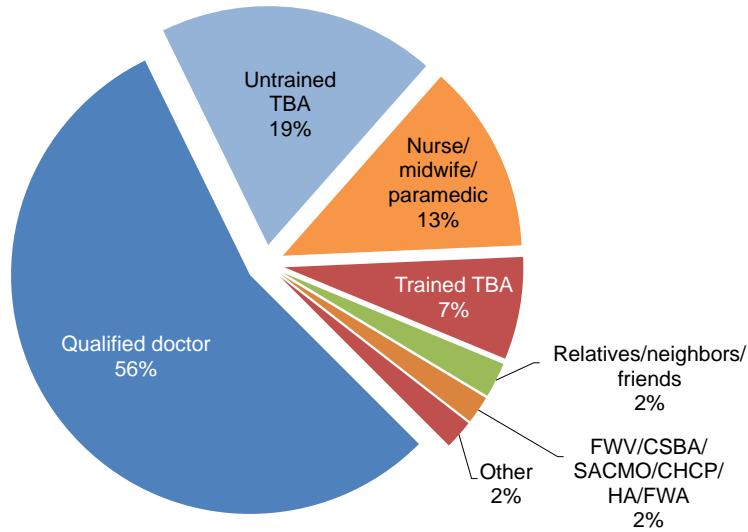

Trends: The proportion of live births assisted by a medically trained provider has increased notably over time, from 23% in the 2007 BDHS to 70% in the 2022 BDHS.

Patterns by background characteristics

- Live births among mothers with at least four ANC visits (84%) are more often assisted by a medically trained provider than births among mothers with no ANC visits (31%) (**Table 9.9**).
- The percentage of deliveries assisted by a medically trained provider is lowest in Mymensingh (57%) and highest in Khulna (87%).

Figure 9.6 Assistance during delivery

Percent distribution of births in the 2 years before the survey

Note: "Other" includes NGO worker and unqualified doctor (1% each).

- The proportion of deliveries assisted by a medically trained provider increases with increasing mother's education, from 48% among mothers with no education to 86% among those with a secondary education or higher.
- Assistance from medically trained providers during delivery also increases with increasing household wealth, from 47% among mothers in the lowest wealth quintile to 91% among those in the highest quintile (**Figure 9.7**).

Duration of Stay at the Health Facility

Among women who underwent a C-section delivery for their most recent live birth, 94% remained in the health facility for at least 3 days following delivery. In contrast, only 11% of those who had a vaginal delivery stayed for the same duration (**Table 9.10**).

Staying at the hospital for 7 days or more after a cesarean section delivery resulting in a live birth is more common in public sector facilities (16%) than private sector facilities (8%) (**Table 9.11**).

Cost of Delivery at a Health Facility

Information on cost of delivery was collected from the survey respondents. Deliveries in private facilities generally incurred higher costs than those in public facilities. For instance, 95% of C-section deliveries in private facilities cost 10,000 takas or more, as compared with 74% of C-section deliveries in public facilities. A similar disparity is observed for normal deliveries, with 41% of C-sections in private facilities falling in that cost range versus 17% in public facilities (**Table 9.12**). Financial payment for deliveries is derived mostly from family sources (85%) (**Table 9.13**). Twenty percent of respondents reported borrowing money to cover delivery costs.

9.6 POSTNATAL CARE

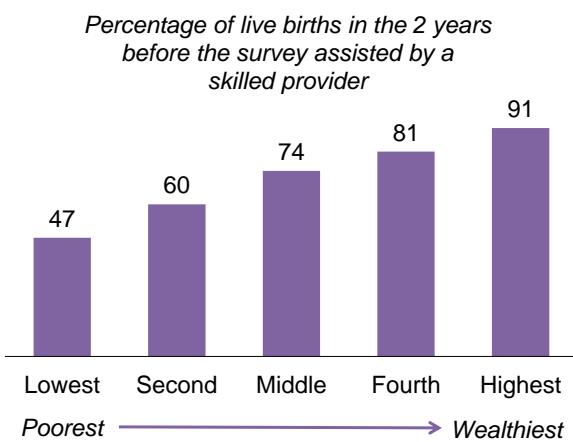

Postnatal care (PNC) stands as a pivotal element in ensuring the well-being of both mothers and newborns. Postnatal check-ups offer a crucial opportunity for evaluating and addressing any potential delivery-related complications and counseling mothers on how to care for themselves and their newborn infant after delivery. The World Health Organization recommends that women receive a postnatal health check within 24 hours after delivery (WHO 2015b). In addition, the first 2 days following delivery are critical for monitoring complications among both mothers and their newborns. The 4th HPNSP aimed to increase coverage of PNC from a medically trained provider within 2 days of birth for noninstitutional deliveries from 5% (the figure reported in the 2014 BDHS) to 10% by 2023.

9.6.1 Postnatal Health Check for Mothers

Overall, 55% of mothers received a postnatal check for their most recent live birth during the first 2 days after delivery, with 43% receiving a check-up within 4 hours of delivery. Fifty-two percent of mothers received a postnatal check for their most recent stillbirth (**Table 9.14**).

Trends: The percentage of mothers giving birth in the 2 years preceding the survey who had their first postnatal check-up within the first 2 days after birth has increased over time, from 29% in the 2011 BDHS to 55% in the 2022 BDHS.

Figure 9.7 Skilled assistance at delivery by household wealth

Patterns by background characteristics

- The proportion of mothers receiving a postnatal check during the first 2 days after delivery for their most recent live birth decreases as birth order increases, from 61% for first-order births to 36% for fourth- or fifth-order births (**Table 9.14**).
- The proportion of mothers who received a postnatal check during the first 2 days after delivery is higher among those who delivered in a health facility than among those who delivered elsewhere (78% versus 13%).
- Less than half of mothers in Barishal (47%), Mymensingh (45%), Rangpur (49%), and Sylhet (45%) received a postnatal check during the first 2 days after birth, as compared with 73% of mothers in Khulna.
- Sixty-seven percent of mothers with a secondary or higher education received a postnatal check during the first 2 days after birth, compared with 37% of those with no education.
- The percentage of mothers receiving postnatal care during the first 2 days after birth increases with increasing household wealth, from 37% among those in the lowest wealth quintile to 72% among those in the highest wealth quintile.

Type of Provider for Mother

Among mothers who had a live birth in the 2 years preceding the survey, 35% received care from qualified doctors during the first 2 days after the delivery of their most recent live birth and 20% received PNC from a nurse, midwife, paramedic, or family welfare visitor; 31% did not receive any check during the first 2 days. Among those who had a stillbirth in the 2 years preceding the survey, 41% did not receive a postnatal check during the first 2 days for their most recent stillbirth (**Table 9.15**). The proportion of mothers receiving a postnatal check from a qualified doctor for their most recent live birth is higher among those who delivered at a health facility than among those who delivered elsewhere (51% versus 5%).

Content of Care for Mother

Among mothers who received a postnatal check after their most recent live birth, 56% had their blood pressure measured, 47% were asked about vaginal bleeding, and 22% were counseled about family planning during the first 2 days. Only 17% had all three critical checks performed in the first 2 days after birth. Among women who received a postnatal check after their most recent stillbirth, 16% had all three checks performed in the first 2 days after delivery (**Table 9.16**).

9.6.2 Postnatal Health Check for Newborns

Proper care for newborns is essential in reducing neonatal morbidity and mortality. The first 48 hours of life are critical, as most neonatal deaths occur within that period (WHO 2015b). Postnatal care for newborns should start as soon as possible after birth.

Fifty-six percent of newborns received a postnatal check within the first 2 days after birth. Sixteen percent had a postnatal check within the first hour of life (**Table 9.17**).

Trends: The percentage of newborns in the 2 years preceding the survey who had their first postnatal check within the first 2 days after birth increased from 39% in the 2011 BDHS to 56% in the 2022 BDHS.

Patterns by background characteristics

- The percentage of newborns receiving a postnatal check during the first 2 days after birth decreases as birth order increases, from 63% among first-order births to 39% among fourth- or fifth-order births (**Table 9.17**).
- Newborns delivered in a health facility are more likely to receive a postnatal check within 2 days of birth than those delivered elsewhere (80% versus 12%).
- By division, Khulna has the highest percentage of newborns receiving a postnatal check within 2 days of birth (74%). Less than half of newborns in Barishal (46%), Mymensingh (45%), and Sylhet (45%) received postnatal checks.
- The likelihood of newborns receiving postnatal checks increases with the mother's level of education. Seventy percent of babies born to mothers with a secondary education or higher received a postnatal check within the first 2 days after birth, as compared with 38% of babies born to mothers with no education.

Type of Provider for Newborns

Thirty-eight percent of newborns received a postnatal check from a qualified doctor during the first 2 days after birth; 18% received care from a nurse, midwife, paramedic, or family welfare visitor (**Table 9.18**). The proportion of newborns receiving a postnatal check from a qualified doctor is higher among those delivered in health facilities than among those delivered elsewhere (56% versus 5%). However, 19% of newborns delivered in health facilities did not receive a postnatal check during the first 2 days after birth.

Content of Care for Newborns

The five recommended signal functions to be performed as part of postnatal care are (1) examining the umbilical cord, (2) measuring temperature, (3) observing and/or counseling on breastfeeding, (4) telling the mother about danger signs and how to recognize if the baby needs immediate attention, and (5) weighing the newborn. Approximately two-thirds of newborns underwent cord examinations, had their temperatures taken, and were weighed. Additionally, 51% of mothers of newborns were both observed while breastfeeding and counseled on the practice, and 33% were instructed on how to recognize if the baby needs immediate medical attention. Overall, 23% of newborns had all five signal functions performed during the first 2 days after birth (**Table 9.19**).

9.6.3 Postnatal Health Checks for Mothers and Newborns

Postnatal health checks are equally vital for the mother and the newborn. **Table 9.20** provides an overview of the receipt of postnatal care by mothers and newborns during the first 2 days after birth. Fifty-five percent of mothers and 56% of newborns received a postnatal check within the first 2 days after birth. In the case of 51% of these births, both the mother and the newborn received a postnatal check. However, in 40% neither the mother nor the newborn had a postnatal check.

The likelihood of mothers and newborns receiving a postnatal check within the first 2 days after birth is higher for births in a health facility (78% and 80%) than for births that take place elsewhere (13% and 12%) (**Figure 9.8**).

9.7 NEWBORN CARE

Newborn primary care focuses on the use of clean instruments to cut the umbilical cord, cord care, bathing delay, prevention of hypothermia, and keeping the newborn warm. Newborns should be dried within minutes after birth and placed on the mother's bare chest. They should not be bathed during the first 24 hours to reduce the risk of hypothermia (WHO 2012). The National Neonatal

Health Strategy and Guidelines for Bangladesh recommends a set of essential newborn care practices (MoHFW 2009). Essential newborn care focuses on using clean instruments to cut the umbilical cord, not applying any substances to the cord, immediate drying (within 5 minutes) to keep the baby warm, delaying bathing until 72 hours after birth, and initiating breastfeeding within 1 hour of delivery.

9.7.1 Care of the Umbilical Cord

Table 9.21 shows that in noninstitutional births, a razor blade was the most common instrument used to cut the umbilical cord (92%). Mustard oil (38%) was the most common substance applied to the cord after it was cut. In 15% of births chlorhexidine was applied to the cord, and nothing was applied to the cord in 31% of births (**Table 9.22**).

Patterns by background characteristics

- Using a razor blade to cut the umbilical cord is more common among births to mothers in the lowest wealth quintile than births to mothers in the highest wealth quintile (95% versus 80%).
- Use of chlorhexidine is slightly more common in urban areas (18%) than in rural areas (14%), while use of mustard oil is more common in rural areas (39% versus 34%) (**Table 9.22**).

9.7.2 Bathing the Newborn

The 2022 BDHS asked mothers who had noninstitutional deliveries in the past 2 years about when the newborn was first bathed. Forty-four percent of newborns are first bathed 72 or more hours following the birth, which is the recommended practice in Bangladesh. Twenty-two percent of newborns are bathed within the first 6 hours of birth, while 26% are bathed within the first 24 hours (**Table 9.23**).

Trends: The percentage of newborns for whom bathing was delayed until at least 72 hours after birth increased from 17% in the 2007 BDHS to 46% in the 2017–18 BDHS but declined slightly to 44% in the 2022 BDHS.

Patterns by background characteristics

- The recommended practice of bathing newborns 72 or more hours after birth is most common in Rajshahi (54%) and least common in Dhaka (35%) (**Table 9.23**).
- Newborns of women with no education are less likely to be bathed 72 or more hours after birth than those born to women with a secondary education or higher (34% versus 59%).

Figure 9.8 Postnatal care by place of delivery

Percentage of most recent live births in the 2 years before the survey for which women and newborns received a postnatal check during the first 2 days after birth

9.7.3 Essential Newborn Care

The survey assessed essential newborn care practices (use of a safe delivery kit or boiled blade to cut the umbilical cord, applying nothing or only chlorhexidine to the cord, immediate drying after birth, bathing delayed 72 or more hours, and immediate breastfeeding) among newborns born outside of a health care facility. The results showed that the five recommended essential newborn care practices were instituted for only 3% of such newborns (**Table 9.24**).

9.8 PROBLEMS IN ACCESSING HEALTH CARE

Problems in accessing health care

Women were asked whether each of the following factors is a big problem in seeking medical advice or treatment for themselves when they are sick:

- Getting permission to go to the doctor
- Getting money for advice or treatment
- Distance to a health facility
- Not wanting to go alone

Sample: Women age 15–49

Two-thirds of women (66%) reported that they have at least one problem in accessing health care. The most commonly reported problem was getting money for treatment (47%), followed by distance to a health facility (46%), not wanting to go alone (40%), and getting permission (26%) (**Table 9.25**).

Patterns by background characteristics

- By division, the proportion of women who have at least one problem in accessing health care is highest in Chattogram and Mymensingh (73% each) and lowest in Khulna and Rangpur (59% each) (**Table 9.25**).
- A larger proportion of women in rural areas (68%) than urban areas (61%) have at least one problem in accessing health care.
- Women in the lowest wealth quintile reported experiencing at least one problem in accessing health care more frequently than those in the highest quintile (75% versus 57%).

LIST OF TABLES

Note: If more than one source of ANC was mentioned, only the provider with the highest qualifications is considered in this tabulation. Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months.

FWV = family welfare visitor

SACMO = sub-assistant community medical officer

CHCP = community health care provider

NGO = nongovernmental organization

¹ Includes health assistant, family welfare assistant, and other providers

² Includes qualified doctor, nurse/midwife/paramedic, FWV, community skilled birth attendant, and SACMO. Antenatal care provided by community skilled birth attendants are not shown separately due to too few cases.

³ Birth order refers to the order of the birth among the respondent's live births.

⁴ For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

Table 9.2 Place of antenatal care

Among women age 15–49 who had a live birth in the 2 years preceding the survey and received ANC, percentage who received antenatal care (ANC) during the pregnancy for the most recent birth by place of ANC care, according to background characteristics, Bangladesh DHS 2022

LIVE BIRTHS AND STILLBIRTHS²								
Total	85.4	75.1	73.6	84.3	86.4	46.2	24.8	3,661

Note: The denominator for this table includes all women with a birth in the 2 years preceding the survey, whether or not they received ANC for that birth. Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months. Figures in parentheses are based on 25–49 unweighted cases.

¹ Birth order refers to the order of the birth among the respondent's live births.

² For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

Table 9.5 Quality of antenatal care

Percentage of women age 15–49 with a live birth in the 2 years preceding the survey who had four or more antenatal care (ANC) visits for the most recent birth, of which at least one was with a medically trained provider; percentage who received all basic ANC components; and percentage who had four or more ANC visits and received all basic ANC components, according to background characteristics, Bangladesh DHS 2022

Background characteristic	Percentage with 4+ ANC visits, at least one with a medically trained provider ¹	Percentage receiving all basic components of ANC ²	Percentage with 4+ ANC visits and all components of ANC	Number of women

LIVE BIRTHS AND STILLBIRTHS																		
Total	55.5	13.2	0.8	0.3	0.1	0.2	0.5	0.5	7.0	18.9	0.5	2.4	0.1	100.0	69.9	3,762	na	na

Note: If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this tabulation. Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months. Figures in parentheses are based on 25–49 unweighted cases.

na = not applicable

CHCP = community health care provider

CSBA = community skilled birth attendant

FWA = family welfare assistant

FWV = family welfare visitor

HA = health assistant

NGO = nongovernmental organization

SACMO = sub-assistant community medical officer

¹ Includes qualified doctor, nurse/midwife/paramedic, FWV, CSBA, and SACMO

² Birth order refers to the order of the birth among the respondent's live births.

³ Includes only the most recent birth in the 2 years preceding the survey

Table 9.10 Duration of stay in health facility after birth

Among women with a live birth and/or stillbirth in the 2 years preceding the survey who delivered their most recent birth in a health facility, percent distribution by duration of stay in the health facility following their most recent birth, according to type of delivery, Bangladesh DHS 2022

Type of delivery	<6 hours	6–11 hours	12–23 hours	1–2 days	3+ days	Don't know/missing	Total	Number of women
LIVE BIRTHS								
Vaginal birth	27.0	10.4	5.4	45.6	11.3	0.3	100.0	718
Cesarean section	2.5	0.1	0.0	3.3	94.1	0.1	100.0	1,609
Don't know/missing	*	*	*	*	*	*	100.0	9
STILLBIRTHS								
Vaginal birth	(28.5)	(2.8)	(0.0)	(43.5)	(25.2)	(0.0)	100.0	29
Cesarean section	*	*	*	*	*	*	100.0	15
Don't know/missing	*	*	*	*	*	*	100.0	2
LIVE BIRTHS AND STILLBIRTHS ¹								
Vaginal birth	27.0	10.1	5.3	45.5	11.9	0.3	100.0	744
Cesarean section	2.5	0.1	0.0	3.2	94.1	0.1	100.0	1,620
Don't know/missing	*	*	*	*	*	*	100.0	12

Note: Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

Table 9.11 Duration of stay in facility after C-section

Among women with a birth in the 2 years preceding the survey who delivered their most recent birth via C-section, percent distribution by duration of stay in the health facility following their most recent live birth, according to type of facility, Bangladesh DHS 2022

Type of health facility	Time spent in facility after delivery					Total	Number of women
	Within 1 day	1–2 days	3–6 days	7 days or more	Don't know/missing		
Public sector	4.5	4.1	75.5	15.9	0.0	100.0	232
NGO sector	(2.0)	(17.1)	(75.8)	(5.1)	(0.0)	100.0	23
Private sector	2.3	2.9	87.0	7.8	0.1	100.0	1,354
Total	2.6	3.3	85.2	8.9	0.1	100.0	1,609

Note: Figures in parentheses are based on 25–49 unweighted cases.
NGO = nongovernmental organization

Table 9.12 Cost of delivery

Percent distribution of most recent births in the 2 years preceding the survey occurring in a health facility by amount spent for delivery, according to type of delivery and type of facility, Bangladesh DHS 2022

Type of delivery and facility	Amount spent on last delivery (Tk)							Number of women
	Nothing	<500	500–999	1,000–4,999	5,000–9,999	10,000 or more	Don't know/missing	
Normal delivery								
Public facility	1.1	1.2	3.4	47.2	28.3	17.0	2.0	100.0
Private facility	0.5	0.0	0.3	17.8	37.8	41.4	2.2	100.0
NGO facility	(0.0)	(0.0)	(0.0)	(29.5)	(44.5)	(17.1)	(8.9)	100.0

NGO facility	0.0	0.0	0.0	19.1	29.1	46.0	5.8	100.0
Total	0.2	0.3	0.7	12.6	13.6	71.2	1.3	100.0
								2,337

Note: Figures in parentheses are based on 25–49 unweighted cases.

NGO = nongovernmental organization

Table 9.13 Source of delivery payment

Percentage of most recent births in the 2 years preceding the survey occurring in a health facility for which money was spent on delivery, by source of payment, Bangladesh DHS 2022

Source of payment	Percent
Family	85.2
Loan	19.7
Sold assets/mortgage	1.7
Gift from family/neighbor/friends	27.1
Voucher/insurance	0.2
Other	0.3
Number of births	2,322

Table 9.14 Timing of first postnatal check for the mother

Among women age 15–49 with a live birth and/or stillbirth in the 2 years preceding the survey, percent distribution of the mother's first postnatal check for the most recent live birth or stillbirth by time after delivery, and percentage of women with a live birth or stillbirth in the 2 years preceding the survey who received a postnatal check during the first 2 days after giving birth, according to background characteristics, Bangladesh DHS 2022

Background characteristic	Time after delivery of mother's first postnatal check ¹						Total	Percentage of women with a postnatal check during the first 2 days after birth ¹	Number of women
	Less than 4 hours	4–23 hours	1–2 days	3–6 days	7–41 days	Don't know/missing

Note: Figures in parentheses are based on 25–49 unweighted cases.

¹ Includes newborns who received a check from a qualified doctor, nurse, midwife, paramedic, family welfare visitor, community skilled birth attendant, and sub-assistant community medical officer

² Includes newborns who received a check after the first week of life or received a check from a non-medically trained provider

³ Birth order refers to the order of the birth among the respondent's live births.

Table 9.18 Type of provider of first postnatal check for the newborn

Percent distribution of most recent live births in the 2 years preceding the survey by type of provider of the newborn's first postnatal health check during the 2 days after the birth, according to background characteristics, Bangladesh DHS 2022

Background characteristic	Provider of newborn's first postnatal check				No postnatal check during the first 2 days after birth	Total	Number of births
	Qualified doctor	Nurse/midwife/paramedic/FWV	CSBA/SACMO	Other non-medically trained provider ¹

CSBA = community skilled birth attendant

FWV = family welfare visitor

SACMO = sub-assistant community medical officer

¹ Includes community health care provider, health assistant, family welfare assistant, nongovernmental organization worker, trained traditional birth attendant (TBA), untrained TBA, unqualified doctor, relative/neighbor/friend, and "other"

² Birth order refers to the order of the birth among the respondent's live births.

Table 9.19 Content of postnatal care for newborns

Among most recent live births in the 2 years preceding the survey, percentage for whom selected functions were performed during the first 2 days after the birth and percentage with five signal functions performed during the first 2 days after the birth, according to background characteristics, Bangladesh DHS 2022

Background characteristic	Percentage of most recent live births for whom a health care provider performed the selected functions during the first 2 days after the birth:							Percentage with five ² signal functions performed during the first 2 days after birth	Number of births
	Cord examined	Temperature measured	Mother told how to recognize if the baby needs immediate medical attention	Mother counseled on breastfeeding	Mother observed breastfeeding	Mother both counseled on breastfeeding and observed breastfeeding	Weighed ¹

Note: Figures in parentheses are based on 25–49 unweighted cases.

¹ Captures newborns who were weighed "at birth." May exclude some newborns who were weighed during the 2 days after birth.

² The functions are (1) examining the umbilical cord, (2) measuring temperature, (3) observing and/or counseling on breastfeeding, (4) telling the mother about danger signs/how to recognize if the baby needs immediate attention, and (5) weighing. Corresponds to the definition of the five signal functions to assess the content of postnatal care for newborns described in Moran et al. 2013.

³ Birth order refers to the order of the birth among the respondent's live births.

Table 9.20 Postnatal checks for mothers and newborns

Among most recent live births in the 2 years preceding the survey, percentage for which mothers age 15–49 received a postnatal check during the first 2 days after birth, percentage for which newborns received a postnatal check during the first 2 days after birth, percentage for which both mothers and newborns received a postnatal check, and percentage for which neither mothers nor newborns received a postnatal check, according to background characteristics, Bangladesh DHS 2022

Background characteristic	Percentage who received a postnatal check ¹ during the first 2 days after birth				Number of births

Key Findings

- **Acute respiratory infection:** Advice or treatment from health facilities or health providers was sought for 84% of children under age 5 with symptoms of acute respiratory infection (ARI).
- **Fever:** 31% of children under age 5 had a fever in the 2 weeks before the survey, and 75% of them were taken to a health facility or qualified health provider for advice or treatment.
- **Diarrhea:** 5% of children under age 5 had diarrhea in the 2 weeks preceding the survey, and advice or treatment was sought for 66% of them. Among children with diarrhea, 77% received oral rehydration therapy (ORT) and 44% were treated with a combination of ORT and zinc.

Information on child health and survival can help policymakers and program managers assess the efficacy of current strategies, formulate appropriate interventions to prevent deaths from childhood illnesses, and improve the health of children in Bangladesh.

This chapter presents information on birth weight for young children and looks at the prevalence of, and care-seeking behaviors for, three common childhood illnesses: symptoms of acute respiratory infection (ARI), fever, and diarrhea.

10.1 CHILD'S SIZE AND BIRTH WEIGHT

Low birth weights (below 2,500 kilograms) are frequently considered a sign of inadequate fetal growth and can lead to various health issues such as brain injury, chronic lung and liver disease, deafness, blindness, epilepsy, intellectual impairment, cerebral palsy, mental retardation, developmental conditions, physical disability, cardiovascular disease, stomach complications, elevated blood pressure, type 2 diabetes, and attention deficit disorder (Islam Pollob et al. 2022). Low-income households face challenges in ensuring adequate nutrition, health care, and medical support for expectant mothers, leading to a higher incidence of low birth weights. This situation often arises due to reliance on a single earner in these households, resulting in limited family income.

Data on birth weight were derived from written records or the mother's report. Overall, information on birth weight was available for 65% of infants (data were captured through written records for 12% of infants and through the mother's recall for 54%).

Table 10.1 shows the distribution of live births in the 2 years preceding the survey by the mother's estimate of her baby's size at birth. Eighty-six percent of live births were reported to be average or larger, 13% were reported as smaller than average, and 1% were reported as very small.

Patterns by background characteristics

- Small size at birth varies by division. The percentage of children reported as being smaller than average or very small is highest in Sylhet (19%), Dhaka (16%), and Chattogram (16%) and lowest in Khulna (11%) (**Table 10.1**).

- Children born to mothers with no education (21%) are more likely to be smaller than average or very small than those born to mothers with a secondary education or higher (12%).
- Similarly, children born to mothers from households in the lowest wealth quintile are more likely to be smaller than average or very small (17%) than children born to mothers from households in the highest wealth quintile (13%).

10.2 SYMPTOMS OF ACUTE RESPIRATORY INFECTION AND CARE-SEEKING BEHAVIOR

Acute respiratory infection (ARI), one of the most common childhood illnesses, leads to a significant number of deaths in low- and middle-income countries where health services are limited, and the quality of care is often substandard. Timely identification and appropriate administration of antibiotics have the potential to decrease ARI-related mortality among children, particularly deaths stemming from pneumonia.

In 1998, the Government of Bangladesh launched the Integrated Management of Childhood Illness (IMCI) initiative, which has since been extensively rolled out across all districts in the country. Most union health and family welfare centers where outpatient services are offered employ sub-assistant community medical officers (SACMOs) to execute IMCI protocols. Additionally, IMCI is practiced in union health centers and community clinics, which serve as primary-level health care facilities in Bangladesh. The 5th Health, Population and Nutrition Sector Program (HPNSP) for the period 2024–2029 aims to enhance both the accessibility and use of child health care services through IMCI (MoHFW 2023).

Care seeking for symptoms of acute respiratory infection (ARI)

Children with symptoms of ARI for whom advice or treatment was sought. ARI symptoms consist of short, rapid breathing that is chest-related and/or difficult breathing that is chest-related.

Sample: Children under age 5 with symptoms of ARI in the 2 weeks before the survey

Table 10.2 shows that only 1% of children under age 5 had symptoms of ARI in the 2 weeks before the survey. Eighty-four percent of children with ARI symptoms were taken to a health facility or provider for advice or treatment; 54% of children were taken for advice or treatment on the same or next day.

Source of Advice or Treatment for Symptoms of ARI

There is a notable disparity in care seeking for children exhibiting ARI symptoms between the private and public sectors. A substantial majority of caregivers of children with symptoms of ARI (70%) seek advice or treatment from private health care sources rather than public sources (17%) (**Table 10.3**).

Within the public sector, specialized government hospitals are the primary choice for advice or treatment, constituting 5% of consultations, followed by upazila health complexes (4%). The most common private sector providers are pharmacies/drug stores (34%) and qualified doctor's chambers (22%).

10.3 FEVER AND CARE-SEEKING BEHAVIOR

In the context of childhood illnesses in Bangladesh, fever emerges as the prevailing and most frequently encountered symptom. Fever in children can be attributed to a variety of causes, from relatively benign conditions such as the common cold to more severe and potentially fatal illnesses such as malaria and dengue hemorrhagic fever. The diverse etiologies of fever necessitate diligent clinical assessment and timely interventions for optimal management and favorable health outcomes.

Care seeking for fever

Children with fever for whom advice or treatment was sought.

Sample: Children under age 5 with a fever in the 2 weeks before the survey

Thirty-one percent of children under age 5 had a fever during the 2 weeks before the survey. Medical advice or treatment was sought from health care facilities or qualified health providers for a substantial proportion (75%), and 52% were taken for advice or treatment either on the day of symptom onset or the following day. According to the survey results, 12% of children with fever were prescribed antibiotics as part of their treatment regimen (**Table 10.4**).

Source of Advice or Treatment for Fever

Sixty-four percent of children under age 5 who had a fever in the 2 weeks before the survey were taken for advice or treatment to private sector providers, as compared with 12% for whom care was sought from the public sector. Among those who were taken for advice or treatment, 60% received treatment from a pharmacy or drug store, while 14% received care from a qualified doctor's chamber (**Table 10.5**). **Table 10.6** shows that among children with a fever in the past 2 weeks, private pharmacies/drug stores were the first source of treatment for 44%, highlighting their significant role as the initial point of care for fever management.

10.4 DIARRHEAL DISEASE

Diarrheal disease remains an important cause of morbidity and mortality among young children in Bangladesh. Oral rehydration therapy (ORT) and supplemental zinc, combined with continued feeding, are the recommended interventions for treating diarrhea. ORT can be provided as increased fluids (especially increased breastfeeding), as fluid prepared from a packet of oral rehydration salts (ORS), or as recommended home fluids (RHF). Zinc has been shown to reduce the severity and duration of diarrhea, and it is recommended that all children with diarrhea receive a 5-day course of zinc.

10.4.1 Diarrhea and Care-seeking Behavior

Care seeking for diarrhea

Children with diarrhea for whom advice or treatment was sought.

Sample: Children under age 5 with diarrhea in the 2 weeks before the survey

According to the 2022 BDHS, diarrhea is the second most prevalent cause of death (11%) among children age 29 days to 11 months in Bangladesh (see Chapter 16). Five percent of children under age 5 had diarrhea in the 2 weeks preceding the survey. Advice or treatment was sought for 66% of children with diarrhea (**Table 10.7**).

Patterns by background characteristics

- Children age 6 to 11 months had the highest prevalence of diarrhea (9%), while those age 36–47 months and 48–59 months had the lowest prevalence (3% each) (**Figure 10.1**).
- By division, Rajshahi has the highest percentage of children with diarrhea (7%) and the lowest percentage of children who were taken for advice or treatment for the condition. Dhaka has the lowest prevalence of diarrhea (3%) (**Table 10.7**).
- Children from households in the lowest wealth quintile have a higher diarrhea prevalence (6%) and are less likely to be taken for advice or treatment (59%) than those from households in the highest wealth quintile (5% and 67%, respectively). Children from households in the middle and fourth wealth quintiles are least likely to have had diarrhea (4% each) and most likely to have been taken for advice or treatment (74% and 69%, respectively).

10.4.2 Feeding Practices

Appropriate feeding practices

Children with diarrhea are given more liquids than usual and as much food or more than usual.

Sample: Children under age 5 with diarrhea in the 2 weeks before the survey

To reduce dehydration and minimize the effects of diarrhea on nutritional status, mothers are encouraged to continue normal feeding of children with diarrhea and to increase the amount of fluids given. Overall, 23% of children under age 5 with diarrhea in the 2 weeks prior to the survey received more fluids than usual, 37% received the same amount, 39% received less, and 2% received no liquids (**Table 10.8** and **Figure 10.2**). In addition, 7% of children received more food than usual, 31% received the same amount, 58% received less, and only 1% received no food.

Figure 10.1 Diarrhea prevalence by age

Percentage of children under age 5
who had diarrhea in the 2 weeks
before the survey

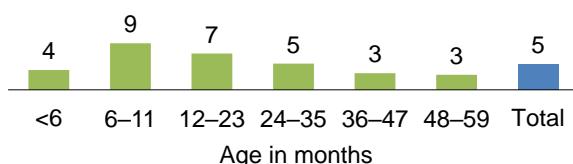

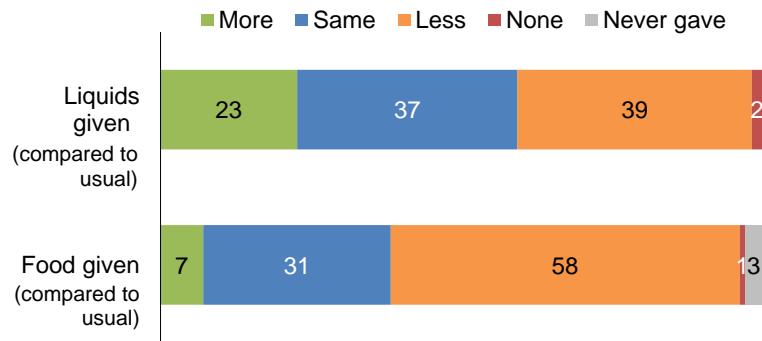

Figure 10.2 Feeding practices during diarrhea

Percentage of children under age 5 with diarrhea in the 2 weeks before the survey

10.4.3 Oral Rehydration Therapy, Zinc, Continued Feeding, and Other Treatments

Oral rehydration therapy

Children with diarrhea are given increased fluids, a fluid made from a special packet of oral rehydration salts (ORS), or recommended home fluids (RHF).

Sample: Children under age 5 with diarrhea in the 2 weeks before the survey

Table 10.9 and **Figure 10.3** show that 77% of children under age 5 with diarrhea in the 2 weeks before the survey received some form of ORT (ORS packets, recommended home fluids, or increased fluids). Around half of children (51%) with diarrhea were given zinc, and 43% received a combination of ORS and zinc. Overall, 55% of children under age 5 who had diarrhea in the 2-week period preceding the survey were given ORT and continued feeding. Fifteen percent did not receive any treatment for diarrhea (**Table 10.9**). Furthermore, less than half (44%) of children received ORT along with zinc (**Table 10.10**).

Trends: The percentage of children with diarrhea receiving ORS rose steadily from 48% in 1996–97 to 83% in 2017–18 before decreasing to 74% in 2022. The percentage of children receiving ORT or increased fluids decreased from 87% in 2017–18 to 77% in 2022. Over the same period, the percentage of children receiving ORT and zinc remained steady at 44%.

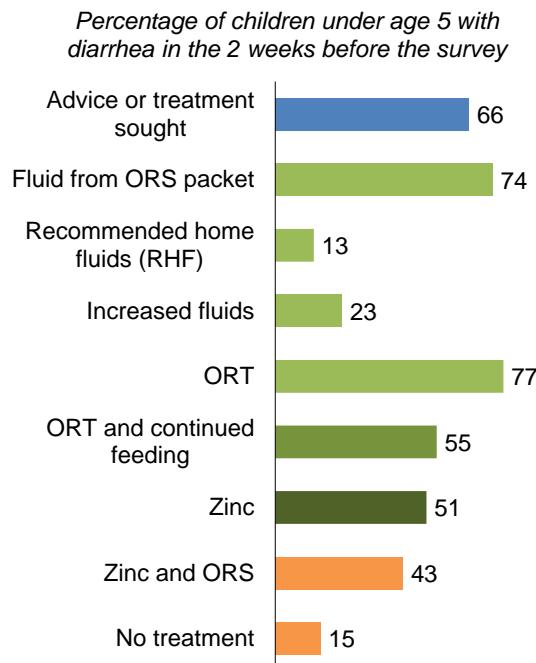

Patterns by background characteristics

- Use of ORS for treating diarrhea is more common in urban areas (83%) than in rural areas (71%). Conversely, use of zinc as a treatment for diarrhea is more common in rural areas (52% versus 48%) (**Table 10.9**).
- The likelihood of using ORS for treating diarrhea rises with increasing household wealth. Specifically, 67% of children from households in the lowest wealth quintile are given ORS for diarrhea, as compared with 80% of those from households in the highest wealth quintile.
- More male children (47%) receive ORT and zinc as part of their diarrheal treatment than female children (40%) (**Table 10.10**).

Source of Advice or Treatment for Diarrhea

Similar to trends observed for ARI symptoms and fever, the private sector is a more common source of advice or treatment for children with diarrhea than the public sector. Fifty-three percent of children with diarrhea were taken to a private sector facility for advice or treatment, while 14% were taken to a public sector facility. Among children for whom advice or treatment was sought, almost half (49%) were taken to a pharmacy/drug store (**Table 10.11**).

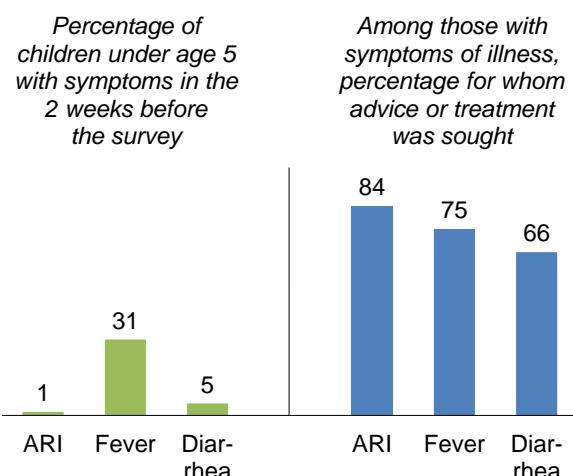

Figure 10.3 Treatment of diarrhea

10.5 TREATMENT OF CHILDHOOD ILLNESS

During the 2 weeks preceding the survey, 1% of children under age 5 had symptoms of ARI, 31% had a fever, and 5% had diarrhea. Advice or treatment was sought for 84% of children experiencing ARI symptoms, 75% of those with a fever, and 66% of those with diarrhea (Figure 10.4).

Figure 10.4 Symptoms of childhood illness and care seeking

LIST OF TABLES

Note: Advice or treatment for children with diarrhea may have been sought from more than one source.

ORS = oral rehydration salts

NGO = nongovernmental organization

¹ Fluid prepared from ORS packet or prepackaged ORS fluid

Key Findings

- **Nutritional status of children:** 24% of children under age 5 are stunted (short for their age), 11% are wasted (thin for their height), 22% are underweight, and 2% are overweight (heavy for their height). The aim of the 4th Health, Population and Nutrition Sector Program (HPNSP) was to reduce stunting from 36% in 2014 to 25% by 2022; this has been achieved.
- **Exclusive breastfeeding:** 53% of children age 0–5 months are exclusively breastfed. The percentage of children who are exclusively breastfed has fluctuated over time (64% in 2011, 55% in 2014, 65% in 2017–18, and 53% in 2022).
- **Minimum acceptable diet:** 30% of children age 6–23 months were fed a minimum acceptable diet in the 24 hours preceding the survey, a drop from 35% in 2017–18. The 4th HPNSP aimed to increase the proportion of children fed a minimum acceptable diet to 45% by 2022.
- **Vitamin A supplementation among children:** 71% of children age 6–59 months received vitamin A supplements in the 6 months before the survey, a decline from 79% in 2017–18.
- **Nutritional status of women:** 9% of ever-married women age 20–49 are underweight, and 38% are overweight or obese.
- **Nutritional status of men:** 16% of men age 20 and older are underweight and 20% are overweight or obese.

Nutrition is an essential component of health and well-being. Children's nutritional well-being not only impacts their immediate health but has long-term implications for their health and wellness as adults. Nutrition also has intergenerational effects on health; for example, malnourished women tend to give birth to unhealthy and malnourished children. Therefore, assessing the nutrition of women and children is important. This chapter reports on the nutritional status of children, adolescents, and adults. In addition, the chapter explores key nutritional behaviors, including breastfeeding and infant and young child feeding (IYCF) practices, and nutrition interventions, including use of iron-containing supplements during pregnancy and micronutrient supplementation and deworming for children. Chapter 9 presents information on measurement of weight during antenatal care and postnatal breastfeeding counseling and observation. Chapter 10 presents information on child feeding practices during diarrhea.

11.1 NUTRITIONAL STATUS OF CHILDREN

Community-based studies commonly rely on two anthropometric measures, height or length, and weight, to examine a child's nutritional status. Three composite indices are formed after comparing the height, weight, and age distributions of children under age 5 with the WHO Child Growth Standards reference population (WHO 2006a). The indices height-for-age, weight-for-height, and weight-for-age can be expressed in standard deviation units (z scores) from the median of the reference population. Values

greater than two standard deviations from the median of the WHO Child Growth Standards are used to define malnutrition.

Stunting (assessed via height-for-age)

Height-for-age is a measure of growth faltering. Children whose height-for-age z score is below minus two standard deviations (-2 SD) from the median of the reference population are considered short for their age (stunted). Children whose z score is below minus three standard deviations (-3 SD) from the median are considered severely stunted.

Sample: Children under age 5

Wasting (assessed via weight-for-height)

The weight-for-height index measures body mass in relation to body height or length and describes acute undernutrition. Children whose weight-for-height z score is below minus two standard deviations (-2 SD) from the median of the reference population are considered thin (wasted). Children whose z score is below minus three standard deviations (-3 SD) from the median are considered severely wasted.

Sample: Children under age 5

Underweight (assessed via weight-for-age)

Weight-for-age is a composite index of height-for-age and weight-for-height that takes into account both wasting and stunting. Children whose weight-for-age z score is below minus two standard deviations (-2 SD) from the median of the reference population are classified as underweight. Children whose z score is below minus three standard deviations (-3 SD) from the median are considered severely underweight.

Sample: Children under age 5

Overweight (assessed via weight-for-height)

Children whose weight-for-height z score is more than two standard deviations (+2 SD) above the median of the reference population are considered overweight.

Sample: Children under age 5

Stunting, or low height-for-age, is a measure of chronic malnutrition among children. Stunting is a marker of the deficient growth environment to which children have been exposed and reflects a population's overall health and well-being (Perumal et al. 2018). The unfavorable growth environment may include inadequate and inappropriate feeding practices, recurrent infections, chronic diseases, and other complex conditions (WHO 2014a).

Wasting, or low weight-for-height, is a measure of acute undernutrition. It represents nutrition deficiency due to inadequate and inappropriate feeding immediately before the survey. Wasting may result from recent episodes of illness caused by infections.

Underweight, or low weight-for-age, is a composite index of weight-for-height and height-for-age. It reflects children who are stunted, wasted, or both. Overweight, or high weight-for-height, results from an imbalance between energy consumed (too much) and energy expended (too little).

The mean z scores for height-for-age, weight-for-height, and weight-for-age may represent the overall nutritional status of children under age 5. A mean z score of less than 0 suggests a downward shift in nutritional status relative to the reference population. The farther away mean z scores are from 0, the higher the prevalence of malnutrition.

11.1.1 Anthropometry Training and Data Collection

Information on anthropometry training, standardization, and data collection methodology can be found in Chapter 1. The 2022 BDHS identified a total of 4,420 children under age 5 who were eligible for height and weight measurements (Appendix C, **Table C.8**). During measurements, 0.6% of children had hairstyles or ornamentation that interfered with height measurement, and 0.2% of children were not minimally dressed or wore heavy permanent ornaments that interfered with weight measurement (Appendix C, **Table C.10**). Valid height-for-age measurements were obtained for 96% of eligible children, valid weight-for-height measurements were obtained for 96% of eligible children, and valid weight-for-age measurements were obtained for 98% of eligible children (Appendix C, **Table C.8**). Appendix C, **Table C.8** provides additional information on the completeness and quality of anthropometry data for children.

Data collection included remeasurement of children as described in Chapter 1. The calculation of final z scores was based on the first measurement among children randomly selected for remeasurement, while the calculation of final z scores was based on the second measurement among children flagged for remeasurement. The remeasurement completion rate was 96%. Appendix C, **Table C.9** provides additional information on remeasurement data (WHO and UNICEF 2019).

11.1.2 Levels of Child Malnutrition

According to the 2022 BDHS, 24% of children under age 5 are stunted, with 6% being severely stunted.

Eleven percent of children are wasted, with 2% severely wasted, and 22% are underweight, with 4% severely underweight. Two percent of children under age 5 are overweight (**Table 11.1**).

Trends: The proportion of children under age 5 who are stunted or underweight declined substantially between 1996 and 2022. Stunting dropped from 60% to 24%, and underweight decreased from 52% to 22%. During the same period, wasting almost halved from 21% to 11%. The prevalence of overweight has remained unchanged over time, at 1% to 2% (**Figure 11.1**).

Although there was a gradual decline in the proportion of severely stunted children in the previous decade, 6% of children under age 5 are severely stunted as of 2022 (**Figure 11.2**).

Patterns by background characteristics

- Children born less than 24 months after a previous birth (short birth interval) are most likely to be stunted (29%), wasted (16%), and underweight (27%) (**Table 11.1**).

Figure 11.1 Trends in child growth measures

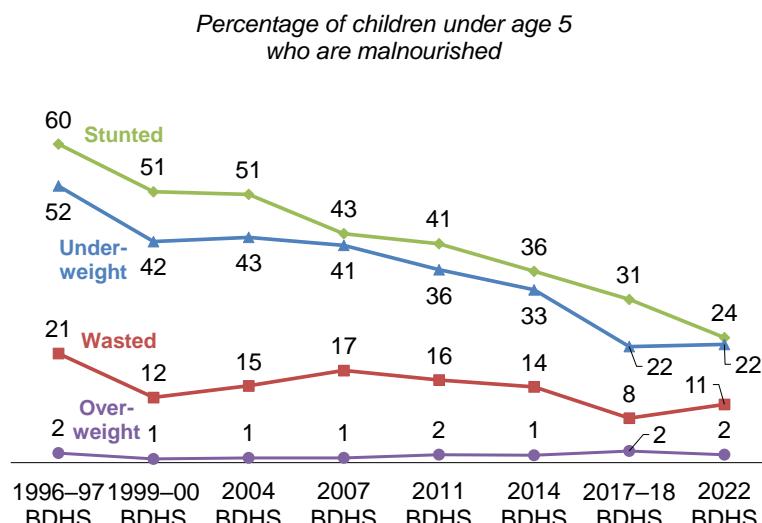

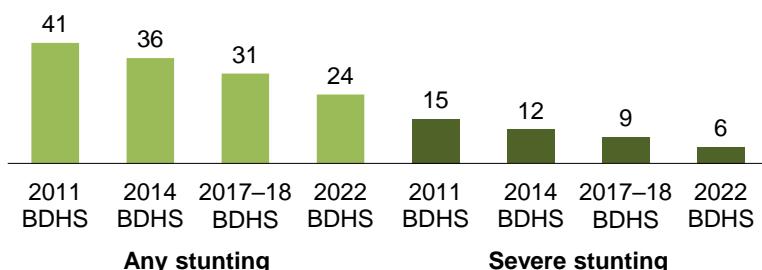

Figure 11.2 Trends in stunting

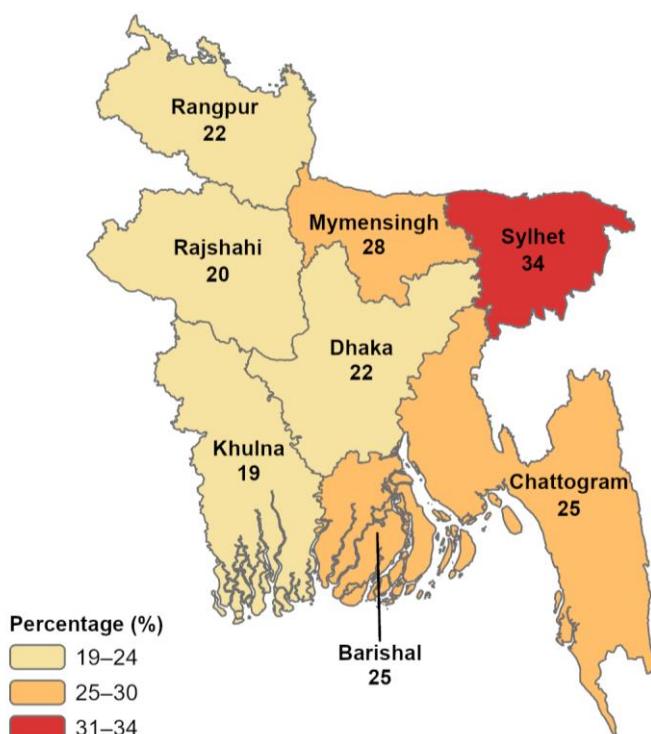

Percentage of children under age 5 who are stunted

- Children with mothers who have no education have a higher prevalence of stunting, wasting, and underweight (39%, 22%, and 43%, respectively) than children whose mothers have a secondary or higher education (16%, 10%, and 16%, respectively).
- There is a significant disparity in the prevalence of stunting and underweight based on household wealth, although the gap is less pronounced for wasting. Fifteen percent of children from households in the highest wealth quintile are stunted and another 15% are underweight. In contrast, 34% of children from households in the lowest wealth quintile are stunted and 32% are underweight. The difference between the highest and lowest wealth quintiles for wasting is relatively small, at 3 percentage points.
- The data indicate variations by division in the prevalence of stunting among children under age 5. For example, 19% of children in Khulna are stunted, as compared with 34% of children in Sylhet (**Map 11.1**).
- There are minimal urban-rural differences in any form of malnutrition among children under age 5.

Map 11.1 Stunting in children by division

Percentage of children under age 5 who are stunted

11.2 INFANT AND YOUNG CHILD FEEDING PRACTICES

Appropriate and adequate infant and young child feeding (IYCF) practices are essential for the health of infants and young children and set the foundation for adult health and well-being. Appropriate IYCF practices include early initiation of breastfeeding (within the first hour after birth), exclusive breastfeeding for the first 2 days after birth, exclusive breastfeeding in the first 6 months of life, continued breastfeeding for 2 years or more, and introduction of safe, appropriate, and adequate complementary foods at age 6 months (WHO and UNICEF 2021).

11.2.1 Ever Breastfed, Early Initiation of Breastfeeding, and Exclusive Breastfeeding for the First 2 Days after Birth

Early breastfeeding initiation is called the child's first vaccine because the first breast milk contains colostrum, which is highly nutritious and has antibodies that can protect the newborn from infections. Early breastfeeding initiation may also enhance mother-child bonding, especially through skin-to-skin contact, and facilitates the production of regular breast milk. In addition, exclusive breastfeeding for 6 months and continuation of breastfeeding for 2 years help the newborn in many ways to be healthy (WHO and UNICEF 2021).

Ever breastfed

Percentage of children born in the past 2 years who were ever breastfed.

Early initiation of breastfeeding

Percentage of children born in the past 2 years who were put to the breast within 1 hour of birth.

Exclusive breastfeeding for the first 2 days after birth

Percentage of children born in the past 2 years who were fed exclusively with breast milk for the first 2 days after birth.

Sample: Children born in the past 2 years

Almost all children (97%) born in the 2 years preceding the survey have been breastfed at some point. However, only 37% of the children born in the past 2 years were put to the breast within the first hour of birth. The percentage of exclusive breastfeeding for the first 2 days after birth is 70% (**Table 11.2**).

Patterns by background characteristics

- Breastfeeding initiation within the first hour of birth is lower among children born in a health facility than those born at home (29% versus 52%). Breastfeeding initiation within the first hour of birth is also lower among mothers who had a cesarean section (24%) than mothers with a vaginal birth (48%).
- By division, breastfeeding initiation in the first hour is lowest among children in Khulna (30%) and Dhaka (33%).
- Children from households in the lowest wealth quintile are more likely to begin breastfeeding within the first hour (42%) than children from households in the highest wealth quintile (31%) (**Table 11.2**).
- There are differences by division in exclusive breastfeeding for the first 2 days after birth. Fifty-six percent of newborns in Rajshahi are exclusively breastfed in that initial period, as compared with 85% of newborns in Sylhet.

11.2.2 Exclusive Breastfeeding and Mixed Milk Feeding

In the first 6 months, children should be exclusively breastfed; that is, they should be given nothing but breast milk. Exclusive breastfeeding provides all of the necessary nutrients that an infant needs for optimal growth and development and lowers the risk of infections that can lead to diarrhea and respiratory illnesses. Mixed milk feeding, in which children are fed both breast milk and formula or animal milk within the first 6 months, has the adverse effect of reducing breast milk output because the production of breast milk is modulated by the frequency and intensity of suckling. Mixed feeding under age 6 months also can increase children's risk of diarrhea, alter their intestinal microflora, and lead to early cessation of breastfeeding (WHO and UNICEF 2021).

Exclusive breastfeeding under 6 months

Percentage of children age 0–5 months who were fed exclusively with breast milk during the previous day.

Sample: Youngest children age 0–5 months living with their mother

Mixed milk feeding under 6 months

Percentage of children age 0–5 months who were fed both breast milk and formula and/or animal milk during the previous day.

Sample: Youngest children age 0–5 months living with their mother

In Bangladesh, only 53% of children age 0–5 months are exclusively breastfed and 22% receive mixed milk feeding (Table 11.3). Eighteen percent of children age 0–5 months are given both breast milk and formula and/or animal milk (including liquid yogurt), 11% are given breast milk along with plain water, and 10% are given breast milk in combination with solid, semisolid, or soft foods (Table 11.4).

Figure 11.3 shows the pattern of how children are fed in the first 6 months of life. Among children age 0–1 month, 73% are exclusively breastfed per WHO recommendations; this proportion falls to 61% among children age 2–3 months. By age 4–5 months, the percentage of children exclusively breastfed drops to 25%. At age 0–1 month, 5% of children are receiving breast milk and plain water, 1% are receiving breast milk and non-milk liquids, 13% are receiving breast milk and formula and/or animal milk, and 2% are receiving breast milk and solid, semisolid, or soft foods. By age 2–3 months, there is a small increase in the provision of breast milk and non-milk liquids or foods, with further increases by age 4–5 months. The most notable increases at 0–5 months are the percentages of children receiving plain water (19%) and solid, semisolid, or soft foods (22%) with breast milk.

Trends: After a steady increase from 36% in 2004 to 64% in 2011, exclusive breastfeeding among children age 0–5 months declined to 55% in 2014, rose to 65% in 2017–18, and fell to 53% in 2022 (Figure 11.4).

Patterns by background characteristics

- There are variations by division in exclusive breastfeeding among children age 0–5 months. While the prevalence of exclusive breastfeeding is 39% in Mymensingh and 65% in Chattogram, it is between 50% and 60% in Khulna, Rajshahi, Rangpur, and Sylhet.

Figure 11.3 Infant feeding practices by age

Percent distribution of youngest children age 0–5 months

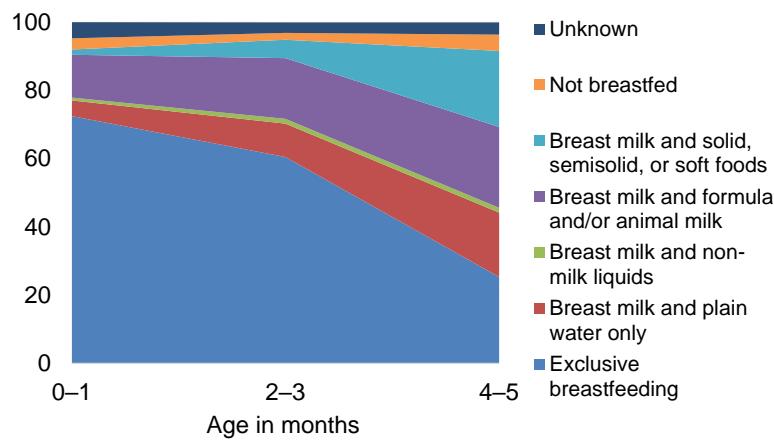

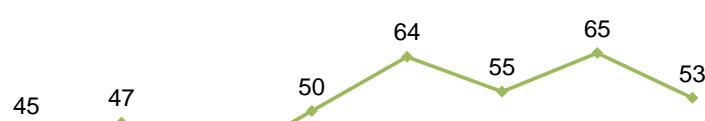

Figure 11.4 Trends in exclusive breastfeeding

Percentage of children under age 5

- The percentage of children age 0–5 months receiving mixed milk feeding is lowest among those in the lowest wealth quintile (13%) and highest among those in the middle wealth quintile (27%).

11.2.3 Continued Breastfeeding and Bottle Feeding

The World Health Organization recommends continuing breastfeeding for the first 2 years or beyond because breast milk lowers children's risk of illness, promotes their recovery during illness, and is an essential source of nutrients for healthy growth and development. Longer durations of breastfeeding have many health benefits for women, including reducing risks of certain breast and ovarian cancers and diabetes. The nipple on a feeding bottle is susceptible to contamination and increases the risk of disease among children (WHO and UNICEF 2021). Thus, bottle feeding is not recommended for children under age 2.

Continued breastfeeding

Percentage of children age 12–23 months who were fed breast milk during the previous day.

Sample: Children age 12–23 months

Bottle feeding

Percentage of children age 0–23 months who were fed from a bottle with a nipple during the previous day.

Sample: Children age 0–23 months

Continued breastfeeding among children age 12–23 months in Bangladesh is high at 88%. Among children age 0–23 months, the practice of bottle feeding remains common (22%) (**Table 11.3**).

Patterns by background characteristics

- Continued breastfeeding is high across background characteristics, with a minimum of 82% among children age 20–23 months and a maximum of 94% among children age 12–15 months (**Table 11.3**).
- Bottle feeding varies by division, with the lowest percentage in Rangpur (13%) and the highest percentage in Dhaka (32%).
- Children age 0–23 months with mothers who have a secondary or higher education and those in the highest wealth quintile are more likely to be bottle fed (25% and 30%, respectively) than children whose mothers have no education and those in the lowest wealth quintile (16% and 14%, respectively).

11.2.4 Introduction of Complementary Foods

After the first 6 months, breast milk alone is no longer sufficient to meet an infant's nutritional needs. Appropriate complementary foods should be introduced while breastfeeding is continued until age 2 or older. The transition from exclusive breastfeeding to complementing breastfeeding with family foods is when children are most vulnerable to becoming undernourished. They should receive solid, semisolid, or soft foods during this time.

Appropriate complementary feeding should include feeding children various foods to meet nutrient requirements. Fruits and vegetables rich in vitamin A should be consumed daily. Eating a range of fruits and vegetables, in addition to those rich in vitamin A, is also important. Studies have shown that plant-based complementary foods alone are insufficient to meet the needs for certain micronutrients. Therefore, it has been recommended that meat, poultry, fish, or eggs be part of the daily diet or eaten as often as possible (WHO 2003).

Introduction of solid, semisolid, or soft foods

Percentage of children age 6–8 months who were fed solid, semisolid, or soft foods during the previous day.

Sample: Youngest children age 6–8 months living with their mother

Overall, 76% of children were introduced to solid, semisolid, or soft foods at age 6–8 months (**Table 11.9**). The most common liquid given to breastfeeding children age 6–8 months is plain water (93%), followed by infant formula such as Lactogen, NIDO, Bimil, Biomil, or Nan (20%) (**Table 11.5**). The most common foods given to breastfeeding children age 6–8 months are foods made from grains (61%) and roots, tubers, or plantains (34%); 21% each receive vitamin A-rich fruits and vegetables and meat, fish, poultry, and organ meat (**Table 11.6**).

11.2.5 Minimum Dietary Diversity, Minimum Meal Frequency, Minimum Milk Feeding Frequency, Minimum Acceptable Diet, and Egg and/or Flesh Food Consumption

To meet their energy and nutrient requirements, infants and young children should receive meals at an appropriate frequency and with a diverse range of foods tailored to their age. The minimum acceptable diet indicator is a combination of minimum dietary diversity and minimum meal frequency for breastfeeding children and the same combination along with minimum milk feeding frequency for nonbreastfed children.

Minimum dietary diversity is a proxy for adequate micronutrient density of foods. Consumption of food from at least five food groups means that the child is more likely to consume at least one animal source of food and at least one fruit or vegetable in addition to a staple food such as grains, roots, or tubers. The five groups should come from a list of eight food groups: breast milk; grains, roots, and tubers; legumes and nuts; dairy products (milk, yogurt, and cheese); flesh foods (meat, fish, poultry, and organ meat); eggs; vitamin A-rich fruits and vegetables; and other fruits and vegetables.

Minimum meal frequency is a proxy for meeting energy requirements. Breastfed children age 6–8 months are considered to be fed with a minimum meal frequency if they receive solid, semisolid, or soft foods at least twice a day. Breastfed children age 9–23 months are considered to be fed with a minimum meal frequency if they receive solid, semisolid, or soft foods at least three times a day. Nonbreastfed children age 6–23 months are considered to be fed with a minimum meal frequency if they receive solid, semisolid, or soft foods or milk feeds at least four times a day and if at least one of the feeds is a solid, semisolid, or soft food.

Minimum milk feeding frequency is a proxy for meeting the nutrient needs of nonbreastfed children. Milk and milk products are important sources of nutrients. Nonbreastfed children age 6–23 months are considered to be fed with a minimum milk feeding frequency if they receive at least two feeds of milk and/or milk products each day.

Egg and/or flesh food consumption by breastfed and nonbreastfed children age 6–23 months increases energy, protein, and nutrient intake. Eggs, meat, fish, poultry, and organ meats are important sources of nutrients that support healthy child growth (WHO and UNICEF 2021).

Minimum dietary diversity

Percentage of children age 6–23 months who were fed a minimum of five out of eight defined food groups during the previous day. The eight food groups are as follows: breast milk; grains, roots, and tubers; legumes and nuts; dairy products (milk, yogurt, and cheese); flesh foods (meat, fish, poultry, and organ meat); eggs; vitamin A-rich fruits and vegetables; and other fruits and vegetables.

Minimum meal frequency

Percentage of children age 6–23 months who were fed solid, semisolid, or soft food (including milk feeds for nonbreastfed children) the minimum number of times or more during the previous day.

Minimum milk feeding frequency

Percentage of nonbreastfed children age 6–23 months who were given at least two milk feeds during the previous day.

Minimum acceptable diet

Percentage of children age 6–23 months who were fed a minimum acceptable diet during the previous day. This indicator is a composite of children fed with a minimum dietary diversity and a minimum meal frequency, with the additional requirement that nonbreastfed children are fed with a minimum milk feeding frequency.

Sample: Youngest children age 6–23 months living with their mother

Egg and/or flesh food consumption

Percentage of children age 6–23 months who were fed eggs and/or flesh food during the previous day.

Sample: Youngest children age 6–23 months living with their mother

Overall, 38% of children age 6–23 months received the minimum number of food groups during the previous day meals and 65% were fed the minimum number of times; only 30% were fed a minimum acceptable diet (**Table 11.7**). Sixty-two percent of the children age 6–23 months were given eggs or flesh food (**Table 11.8**).

Patterns by background characteristics

- By division, the percentage of children age 6–23 months fed with a minimum dietary diversity is highest in Khulna (53%) and lowest in Sylhet (26%). The percentage of children fed with a minimum meal frequency is highest in Khulna (82%) and lowest in Chattogram (51%) (**Table 11.7**).
- Minimum dietary diversity increases as mother's educational level rises, from 21% among children whose mothers have no education to 48% among children whose mothers have a secondary education or higher.
- Likewise, children from households in the lowest wealth quintile are less likely to be fed with a minimum dietary diversity than children from households in the highest wealth quintile (26% versus 54%).
- The percentage of children age 6–23 months who are fed eggs or flesh food is highest in Khulna (75%) and lowest in Sylhet (47%).
- Seventy-one percent of children age 6–23 months whose mothers have a secondary or higher education receive eggs or flesh food, as compared with 47% of children whose mothers have no education (**Table 11.8**).

- Similarly, only 55% of children from households in the lowest wealth quintile consume eggs or flesh food, compared with 72% of children from households in the highest wealth quintile.

11.2.6 Sweet Beverage Consumption, Unhealthy Food Consumption, and Zero Vegetable or Fruit Consumption among Children

Unhealthy infant and young child feeding practices should be avoided because they can replace nutritious foods that provide important nutrients for children and promote unhealthy weight gain. For infants and young children, consuming sweet foods and beverages increases the risk of dental caries and obesity in childhood. In addition, too much salt in the diet increases the risk of noncommunicable diseases, and unhealthy fats and refined carbohydrates contribute to unhealthy weight gain. Children consuming diets low in vegetables and fruits have reduced nutrient intakes, which can negatively impact healthy growth and development. Low vegetable and fruit consumption is also associated with noncommunicable diseases later in life. The indicator definition below for unhealthy food consumption describes “sentinel unhealthy foods,” which are foods high in sugar, salt, and/or unhealthy fats that are commonly consumed by infants and young children (WHO and UNICEF 2021).

Sweet beverage consumption

Percentage of children age 6–23 months who were given a sweet beverage during the previous day.

Unhealthy food consumption

Percentage of children age 6–23 months who were fed sentinel unhealthy foods during the previous day.

Zero vegetable or fruit consumption

Percentage of children age 6–23 months who were not fed any vegetables or fruits during the previous day.

Sample: Youngest children age 6–23 months living with their mother

Forty-nine percent of children age 6–23 months consumed unhealthy foods during the previous day, while 32% consumed sweet beverages. Forty-six percent of children were not fed any fruits or vegetables (**Table 11.8**).

Patterns by background characteristics

- Higher levels of education among mothers do not necessarily reduce the likelihood of unhealthy food consumption among children. Unhealthy food consumption is lowest among children whose mothers have no education (45%) and highest among children whose mothers who have a secondary incomplete education (52%).
- Children from households in the highest wealth quintile are more likely to consume sweet beverages than those from households in the lowest wealth quintile (39% and 25%, respectively).
- The percentage of children given unhealthy foods varies substantially by division, from a high 68% in Rangpur to a low of 34% in Barishal (**Table 11.8**).

- The percentage of children who are not consuming fruits or vegetables decreases with increasing mother's education. Fifty-eight percent of children whose mothers have no education do not consume fruits or vegetables, as compared with 37% of children whose mothers have a secondary education or higher (**Figure 11.5**).
- Similarly, the percentage of children who are not consuming fruits or vegetables decreases with increasing household wealth, from 50% among those from households in the lowest wealth quintile to 35% among those from households in the highest wealth quintile.

Figure 11.5 Unhealthy feeding practices among children age 6–23 months by mother's education

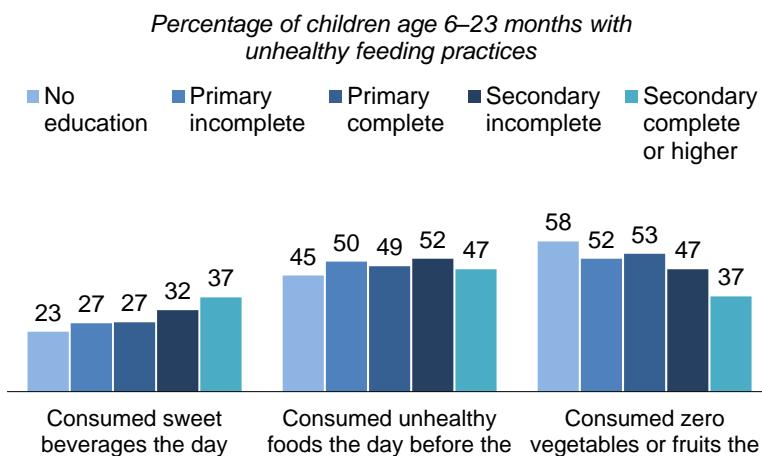

Table 11.9 summarizes all 16 WHO-UNICEF IYCF indicators. These indicators align with the 2nd National Plan of Action for Nutrition 2016–2025 of Bangladesh (MoHFW 2017b).

11.3 MICRONUTRIENT SUPPLEMENTATION AND DEWORMING AMONG CHILDREN

Micronutrient deficiency is one of the major contributors to childhood morbidity and mortality. Micronutrient deficiency can be caused by a lack of consumption of foods that supply vitamins and minerals, as well as by infections, genetic abnormalities, and other factors. Strategies to prevent micronutrient deficiency include biofortification, food fortification, and direct micronutrient supplementation (USAID 2019).

Common micronutrient deficiencies in low- and middle-income countries are iron deficiency and vitamin A deficiency. Iron deficiency is one of the primary causes of anemia. Interventions targeting iron deficiency and anemia include periodically giving children iron tablets or syrup and/or iron-containing micronutrient powders (WHO 2011a; WHO 2016a; WHO 2016b).

Vitamin A is a micronutrient that supports the immune system and plays an important role in maintaining the epithelial tissue in the body. Severe vitamin A deficiency can cause eye damage, increase the severity of infections such as those causing measles, and slow recovery from illness. Vitamin A supplementation programs help reduce vitamin A deficiency and mortality in children (WHO 2011b).

Soil-transmitted helminth infections can cause internal bleeding, inflammation, impaired nutrient absorption, diarrhea, vomiting, and loss of appetite. Deworming programs help reduce the burden of helminth infections (WHO 2017b).

Iron tablets or syrup

Percentage of children age 6–59 months who were given iron tablets or syrup in the past 12 months.

Multiple micronutrient powders

Percentage of children age 6–59 months who were given multiple micronutrient powders in the past 12 months.

Iron-containing supplements

Percentage of children age 6–59 months who were given iron-containing supplements in the past 12 months, including tablets, syrup, or micronutrient powders.

Sample: Children age 6–59 months

Vitamin A supplements

Percentage of children age 6–59 months who were given vitamin A supplements in the past 6 months.

Sample: Children age 6–59 months

Deworming medication

Percentage of children age 12–59 months who were given deworming medication in the past 6 months.

Sample: Children age 12–59 months

Table 11.10 shows that 71% of children age 6–59 months were given vitamin A supplements in the past 6 months. However, only 5% of children received iron tablets or syrup in the past 7 days, while 2% received multiple micronutrient powders and 7% received iron-containing supplements. More than half of children age 12–59 months (52%) received deworming medication in the past 6 months.

Patterns by background characteristics

- Thirty-six percent of children age 12–23 months received deworming medication in the past 6 months, as compared with 57% of children age 24–59 months (**Table 11.10**).
- The percentage of children age 12–59 months who received deworming medication is lower among those who are breastfeeding (42%) than among those who are not breastfeeding (59%).

11.4 ADULTS' NUTRITIONAL STATUS

Chronic energy deficiency is caused by eating too little or having an unbalanced diet that lacks adequate nutrients. Women of reproductive age (age 15–49) are especially vulnerable to chronic energy deficiency and malnutrition due to low dietary intakes, inequitable distribution of food within the household, improper food storage and preparation, dietary taboos, infectious diseases, and inadequate care practices. Chronic energy deficiency leads to low productivity among adults and greater morbidity and mortality (WHO 1995). In addition, undernutrition among women is a major risk factor for adverse birth outcomes. Overweight and obesity have adverse health outcomes as well. Overweight and obesity are major risk factors for several chronic diseases, including diabetes, cardiovascular diseases, and cancer.

Body mass index (BMI) is the ratio of weight relative to height squared; it is used to measure nutritional status in adults age 20–49. BMI values are independent of age and sex. Adult women age 20–49 whose height is less than 145 centimeters are classified as being of short stature.

BMI-for-age, the ratio of weight relative to height for different age groups, is used to measure nutritional status in children and adolescents age 5–19 (WHO 2007). BMI-for-age is sex and age specific. The reason is that children and adolescents are still growing and the timing of peak growth velocity differs in boys and

girls. In the DHS surveys, BMI-for-age is reported among adolescents age 15–19. Similarly, short stature among adolescent women (age 15–19) is assessed according to low height-for-age.

Body mass index (BMI)

BMI is calculated by dividing weight in kilograms by height in meters squared (kg/m^2).

Adult status	BMI
Too thin for height	Less than 18.5
Normal	Between 18.5 and 24.9
Overweight	Between 25.0 and 29.9
Obese	Greater than or equal to 30.0

Sample: Women age 20–49 who are not pregnant and who have not had a birth in the 2 months before the survey and men age 20 and above

BMI-for-age

BMI-for-age is measured in z score standard deviations (SD).

Adolescent status	BMI-for-age
Too thin for height	Less than -1 SD
Normal	Between -1 SD and +1 SD
Overweight	Between +1 SD and +2 SD
Obese	Greater than +2 SD

Sample: Women age 15–19 who are not pregnant and who have not had a birth in the 2 months before the survey and men age 18–19

Short stature

Percentage of women age 20–49 with height under 145 cm.

Sample: Women age 20–49

Percentage of women age 15–19 with height-for-age z score less than -2 SD.

Sample: Women age 15–19

11.4.1 Nutritional Status of Women

Height and weight data were collected for 98% of eligible women age 15–49 (Appendix C, **Table C.6**). During measurements, 1% of women had hairstyles or ornamentation that interfered with height measurement, and less than 1% of women were not wearing lightweight clothing or wore heavy permanent ornaments that interfered with weight measurement (Appendix C, **Table C.11**). Because of the difference in the calculation of nutritional status for adolescents and adults, data on the nutritional status of adolescent women age 15–19 and adult women age 20–49 are reported separately.

Among ever-married women age 20–49, only 9% are underweight, while 38% are either overweight or obese. Three percent of women are moderately or severely thin, and 8% are obese. Eleven percent of women are of short stature. Among ever-married women age 15–19, 25% are underweight and 14% are overweight or obese. Four percent of young women are moderately or severely thin, and 2% are obese. Thirty percent of women age 15–19 are of short stature (**Table 11.11.1**, **Table 11.11.2**, and **Figure 11.6**).

Patterns by background characteristics

- Women age 20–29 are nearly twice as likely to be underweight as those age 30–39 (12% versus 7%). Conversely, the prevalence of overweight or obesity is 12 percentage points higher among women age 30–39 than among those age 20–29 (42% versus 30%) (**Table 11.11.1**).
- Obesity is more prevalent in urban areas than rural areas. Forty-eight percent of urban women are overweight or obese, as compared with 35% of rural women. In contrast, 6% of urban women are underweight, compared with 10% of rural women.
- By division, the proportion of women age 20–49 who are thin is highest in Sylhet (16%) and lowest in Khulna (6%). Women in Dhaka are most likely to be overweight or obese (44%) (**Table 11.11.1**).
- Women with a secondary education or higher are more likely to be overweight or obese than women who have never attended school (44% versus 28%) (**Table 11.11.1**).
- The percentage of adolescent women age 15–19 who are underweight ranges from 14% in Dhaka to 33% in Rangpur (**Table 11.11.2**).
- The percentage of adolescent women who are overweight or obese is nearly three times higher among those in the highest wealth quintile than among those in the lowest wealth quintile (22% and 8%, respectively) (**Table 11.11.2**).

11.4.2 Nutritional Status of Men

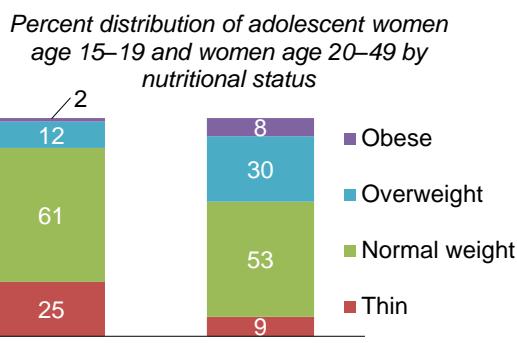

The 2022 BDHS collected height and weight data for 92% of eligible men age 15–49 (Appendix C, **Table C.6**). During measurements, 1% of men had hairstyles or ornamentation that interfered with height measurement, and less than 1% of men were not wearing lightweight clothing or wore heavy permanent ornaments that interfered with weight measurement (Appendix C, **Table C.11**). Because of the difference in the calculation of nutritional status for adolescents and adults, data on the nutritional status of adolescent men age 18–19 and adult men age 20 and older are reported separately.

Among men age 20 or older, 16% are underweight and 20% are overweight or obese. Only 6% are moderately or severely thin, and 2% are obese (**Table 11.11.3**). Half of adolescent men age 18–19 are underweight, while only 6% are overweight or obese (**Table 11.11.4**).

Patterns by background characteristics

- The proportion of underweight men declines from 20% in the 20–29 age group to 11% in the 30–39 age group and then rises as age increases. Close to 3 out of 10 men (28%) age 70 or older are underweight (**Table 11.11.3**).

Figure 11.6 Nutritional status of adolescent and adult women

- Men in urban areas are more likely to be overweight or obese than their rural counterparts (29% versus 17%).
- The percentage of underweight men is highest in Mymensingh (25%) and lowest in Chattogram (12%).
- Eight percent of men in the highest wealth quintile are underweight, as compared with 25% of men in the lowest wealth quintile.

11.5 IRON-CONTAINING SUPPLEMENTATION DURING PREGNANCY

Over half (53%) of women with a birth in the 2 years preceding the survey took iron-containing supplements (iron tablets or syrup) for at least 90 days during their most recent pregnancy. However, almost one-fifth of women (19%) took no iron-containing supplements during their most recent pregnancy (**Table 11.12**).

Patterns by background characteristics

- By division, the proportion of women who took iron-containing supplements for 90 days or more during their most recent pregnancy is lowest in Sylhet (44%) and highest in Chattogram (58%) (**Table 11.12**).
- The proportion of women with a secondary education or higher who took iron-containing supplements for 90 days or more during their most recent pregnancy is twice that of women with no education (67% versus 33%).
- Women from households in the highest wealth quintile were more likely to take iron-containing supplements for at least 90 days during their most recent pregnancy than those from households in the lowest wealth quintile (72% versus 40%).

Note: Each of the indices is expressed in standard deviation units (SD) from the median of the WHO Child Growth Standards (WHO 2006a). An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ Recumbent length is measured for children under age 2; standing height is measured for all other children.

² Includes children who are below -3 standard deviations (SD) from the WHO Child Growth Standards population median.

³ Excludes children whose mothers were not interviewed.

⁴ First-born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval.

⁵ Information available only for children age 0–35 months.

⁶ Includes children whose mothers are deceased.

⁷ Excludes children whose mothers were not weighed and measured, children whose mothers were not interviewed, and children whose mothers are pregnant or gave birth within the preceding 2 months. Mother's nutritional status is defined using body mass index (BMI) for mothers age 20–49 and BMI-for-age for mothers age 15–19 as presented in Tables 11.11.1 and 11.11.2.

⁸ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the Household Questionnaire.

Table 11.2 Early breastfeeding

Percentage of children born in the past 2 years who were ever breastfed, percentage who were put to the breast within 1 hour of birth, and percentage who were exclusively breastfed for the first 2 days after birth, according to background characteristics, Bangladesh DHS 2022

Note: Table is based on children born in the 2 years preceding the survey regardless of whether the children were living or dead at the time of the interview. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

PNC = postnatal care

¹ Children given nothing other than breast milk to eat or drink during the first 2 days after delivery.

² Qualified doctor, nurse/midwife/paramedic, family welfare visitor, community skilled birth attendant, and sub-assistant community medical officer

³ Women were asked about counseling on breastfeeding by any health care provider in the first 2 days after their most recent live birth regardless of where they gave birth. Information is available for the most recent live birth only.

Table 11.3 Breastfeeding status according to age

Among youngest children age 0–5 months living with their mother, percentage exclusively breastfeeding and percentage receiving mixed milk feeding; among all children age 12–23 months, percentage currently breastfeeding; and among all children age 0–23 months, percentage using a bottle with a nipple, according to background characteristics, Bangladesh DHS 2022

Background characteristic	Among youngest children age 0–5 months living with their mother:			Among all children age 12–23 months:		Among all children age 0–23 months:	
	Percentage exclusively breastfeeding	Percentage receiving mixed milk feeding ¹	Number of children	Percentage currently breast-feeding ²	Number of children	Percentage using a bottle with a nipple	Number of children

Total	53.4	21.8	941	88.3	1,653	22.2	3,597

Note: Breastfeeding status refers to a “24-hour” period (yesterday during the day or at night). Figures in parentheses are based on 25–49 unweighted cases.

na = not applicable

¹ Received breast milk and infant formula and/or fresh, packaged, or powdered animal milk. Excludes yogurt drinks because they are generally not fed as a substitute for breast milk. Excludes soy and nut milks.

² Corresponds to the IYCF indicator “continued breastfeeding”

Table 11.4 Infant feeding practices by age

Percent distribution of youngest children age 0–5 months living with their mother by feeding category, according to age in months, Bangladesh DHS 2022

Age group in months	Breast milk only (exclusively breastfed)	Breast milk and plain water only	Breast milk and non-milk liquids ¹	Breast milk and/or animal milk ²	Breast milk and solid, semisolid, or soft foods ³	Not breastfed	Unknown ⁴	Total	Number of youngest children 0–5 months living with their mother
0–1	72.5	4.6	0.8	12.6	1.5	3.3	4.8	100.0	340
2–3	60.5	9.8	1.4	17.8	5.4	2.0	3.1	100.0	295
4–5	25.3	18.9	1.4	23.7	22.3	4.8	3.6	100.0	305
0–5	53.4	10.8	1.2	17.8	9.5	3.4	3.9	100.0	941

Note: Breastfeeding status refers to a “24-hour” period (yesterday during the day or at night). The categories of breast milk only, breast milk and plain water only, breast milk and non-milk liquids, breast milk and formula and/or animal milk, breast milk and solid, semisolid, or soft foods, and not breastfed are hierarchical and mutually exclusive. Thus, children who receive breast milk and non-milk liquids and who do not receive breast milk and formula and/or animal milk and who do not receive any solid, semisolid, or soft foods are classified in the non-milk liquid category even though they may also get plain water. When combined with children whose feeding category is classified as unknown due to “don’t know” responses, the percentages in each row add to 100%.

¹ Non-milk liquids include fruit juice or fruit-flavored drinks, chocolate-flavored drinks, sodas, clear broth or soup, tea, coffee, herbal drinks, and other liquids.

² Animal milk here includes liquid yogurt but does not include solid yogurt. Note that animal milk in Table 11.3 excludes liquid yogurt and solid yogurt.

³ Solid, semisolid, or soft foods includes solid yogurt but not liquid yogurt.

⁴ Not classified elsewhere due to “don’t know” responses

Table 11.5 Liquids consumed by children in the day or night preceding the interview

Percentage of youngest children under age 2 living with their mother by type of liquids consumed in the day or night preceding the interview, according to age and breastfeeding status, Bangladesh DHS 2022

Age in months	Plain water	Infant formula ¹	Fresh, powdered, and packaged animal milk		Yogurt drinks		Fruit juice, packet juice such as Frooto or Tang, or shorbot	Soft drinks such as Pepsi, Mojo, Sprite, or Fanta	Tea, coffee, and herbal drinks		Clear broth or soup	Other liquids ²		Number of youngest children under age 2 living with their mother

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ Includes rice, paratha, ruti, maize, semai, rice pudding, and packaged cereal such as Cerelac

² Includes potato, plantain, arum, and sweet potato

³ Includes daal, chickpeas, khichuri, peanuts, and jackfruit seeds

⁴ Includes cheeses and paneer

⁵ Includes liver, gizzard, sausages, other meat (such as beef or goat meat), chicken, pigeon, duck, fish, and dried fish

⁶ Includes pumpkin, carrots, lal shak, pui shak, amaranth, spinach, other shak, ripe mango, ripe papaya, and orange musk melon

⁷ Includes eggplant, lady finger, long beans, bottle gourd, bitter gourd, guava, ripe banana, jackfruit, jamrud, and malta

Table 11.7 Minimum dietary diversity, minimum meal frequency, and minimum acceptable diet among children

Percentage of youngest children age 6–23 months living with their mother who are fed a minimum acceptable diet based on breastfeeding status, number of food groups, and times they are fed during the day or night preceding the survey, according to background characteristics, Bangladesh DHS 2022

Background characteristic	Among youngest breastfed children age 6–23 months living with their mother, percentage fed:				Among youngest nonbreastfed children age 6–23 months living with their mother, percentage fed:				Among all youngest children age 6–23 months living with their mother, percentage fed:				
	Minimum dietary diversity ¹	Minimum meal frequency ²	Minimum acceptable diet ³	Number of breastfed children age 6–23 months	Minimum milk feeding frequency ⁴	Minimum dietary diversity ¹	Minimum meal frequency ⁵	Minimum acceptable diet ⁶	Number of nonbreastfed children age 6–23 months	Minimum dietary diversity ¹	Minimum meal frequency ⁷	Minimum acceptable diet ⁸	Number of all children age 6–23 months

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ Minimum dietary diversity is receiving foods from five or more of the following eight food groups: a. breast milk; b. grains, white/pale starchy roots, tubers, and plantains; c. beans, peas, lentils, nuts, and seeds; d. dairy products (fresh, packaged, or dried milk from animals; infant formula; yogurt; cheese); e. flesh foods (meat, fish, poultry, organ meats); f. eggs; g. vitamin A-rich fruits and vegetables; h. other fruits and vegetables.

² For breastfed children, minimum meal frequency is receiving solid, semisolid, or soft food at least twice a day for infants age 6–8 months and at least three times a day for children age 9–23 months.

³ For breastfed children, minimum acceptable diet is being fed a minimum dietary diversity (footnote 1) and a minimum meal frequency (footnote 2).

⁴ For nonbreastfed children, minimum milk feeding frequency is two or more feedings of infant formula; fresh, packaged, or dried milk from animals; and liquid or solid yogurt.

⁵ For nonbreastfed children, minimum meal frequency is receiving solid, semisolid, or soft food or milk feeds at least four times a day. At least one of the feeds must be a solid, semisolid, or soft feed.

⁶ For nonbreastfed children, minimum acceptable diet is being fed a minimum dietary diversity (footnote 1), a minimum milk feeding frequency (footnote 4), and a minimum meal frequency (footnote 5).

⁷ Minimum meal frequency is receiving the minimum recommended number of feeds per day according to age and breastfeeding status as defined in footnotes 2 and 5.

⁸ Minimum acceptable diet is being fed a minimum dietary diversity (footnote 1), a minimum meal frequency (footnote 2 and footnote 5), and a minimum milk feeding frequency (footnote 4).

Table 11.8 Egg and/or flesh food consumption and unhealthy feeding practices among children age 6–23 months

Percentage of youngest children age 6–23 months living with their mother who consumed eggs and/or flesh food, and percentage who experienced specified unhealthy feeding practices, during the day or night preceding the survey, according to background characteristics, Bangladesh DHS 2022

Background characteristic	Eggs and/or flesh food ¹	Unhealthy feeding practices:			Number of youngest children age 6–23 months living with their mother
		Sweet beverage ²	Unhealthy food ³	Zero vegetables or fruits ⁴

¹ Eggs and/or flesh food include liver, gizzard, sausages, other meat (such as beef, goat meat, chicken, pigeon, or duck), fish or dried fish, and eggs.

² Sweet beverages include sweet/flavored milk, yogurt drinks, fruit juice and fruit-flavored drinks, chocolate-flavored drinks, sodas, sweetened tea, coffee, herbal drinks, and other sweetened liquids.

³ Unhealthy foods are a group of sentinel food types that include sweet foods such as mishti, sweet biscuits, cakes, halwa, jilapi, chocolate, and ice cream and fried or salty foods such as chips, puri, singara, samucha, pakora, chop, and instant noodles (e.g., Maggi noodles or Pran's Mr. Noodle).

⁴ Vegetables or fruits include lal shak, pui shak, amaranth, spinach, any other shak, pumpkin, carrots, ripe mangoes, ripe papayas, orange musk melon, guava, ripe banana, jackfruit, jamrul, malta, eggplant, lady finger, long beans, bottle gourd, and bitter gourd.

Table 11.9 Infant and young child feeding (IYCF) indicators

Percentage of children fed according to various IYCF practices, Bangladesh DHS 2022

IYCF #	IYCF abbrev.	DHS8 Table #	Indicator	Indicator definition and denominator	Value
1	EvBF	11.2	Ever breastfed ¹	Percentage of children born in the last 2 years who were ever breastfed Number of children born in the last 2 years	97.1 3,691
2	EIBF	11.2	Early initiation of breastfeeding ¹	Percentage of children born in the last 2 years who were put to the breast within 1 hour of birth Number of children born in the last 2 years	36.9 3,691
3	EBF2D	11.2	Exclusively breastfed for the first 2 days after birth ¹	Percentage of children born in the last 2 years who were fed exclusively with breast milk for the first 2 days after birth Number of children born in the last 2 years	69.7 3,691
4	EBF	11.3	Exclusive breastfeeding under 6 months	Percentage of children age 0–5 months who were fed exclusively with breast milk during the previous day Number of youngest children age 0–5 months living with the mother	53.4 941
5	MixMF	11.3	Mixed milk feeding under 6 months	Percentage of children age 0–5 months who were fed both breast milk and formula and/or animal milk during the previous day Number of youngest children age 0–5 months living with the mother	21.8 941
6	CBF	11.3	Continued breastfeeding 12–23 months	Percentage of children age 12–23 months who were fed breast milk during the previous day Number of children age 12–23 months	88.3 1,653
7	ISSSF	-	Introduction of solid, semisolid or soft foods 6–8 months	Percentage of children age 6–8 months who were fed solid, semisolid or soft foods during the previous day Number of youngest children age 6–8 months living with the mother	75.9 473
8	MDD	11.7	Minimum dietary diversity 6–23 months	Percentage of children age 6–23 months who were fed foods and beverages from at least 5 out of 8 defined food groups during the previous day Number of youngest children age 6–23 months living with the mother	37.6 2,578
9	MMF	11.7	Minimum meal frequency 6–23 months	Percentage of children age 6–23 months who were fed solid, semisolid, or soft foods (but also including milk feeds for non-breastfed children) the minimum number of times or more during the previous day Number of youngest children age 6–23 months living with the mother	65.3 2,578
10	MMFF	11.7	Minimum milk feeding frequency for non-breastfed children 6–23 months	Percentage of non-breastfed children age 6–23 months who were given at least two milk feeds during the previous day Number of youngest children age 6–23 months living with the mother who were not breastfed	51.1 193
11	MAD	11.7	Minimum acceptable diet 6–23 months	Percentage of children age 6–23 months who were fed a minimum acceptable diet during the previous day Number of youngest children age 6–23 months living with the mother	29.6 2,578
12	EFF	11.8	Egg and/or flesh food consumption 6–23 months	Percentage of children age 6–23 months who were fed egg and/or flesh food during the previous day Number of youngest children age 6–23 months living with the mother	62.1 2,578
13	SWB	11.8	Sweet beverage consumption 6–23 months	Percentage of children age 6–23 months who were given a sweet beverage during the previous day Number of youngest children age 6–23 months living with the mother	31.5 2,578
14	UFC	11.8	Unhealthy food consumption 6–23 months	Percentage of children age 6–23 months who were fed selected sentinel unhealthy foods during the previous day Number of youngest children age 6–23 months living with the mother	49.4 2,578
15	ZVF	11.8	Zero vegetable or fruit consumption 6–23 months	Percentage of children age 6–23 months who were not fed any vegetables or fruits during the previous day Number of youngest children age 6–23 months living with the mother	45.9 2,578
16	BoF	11.3	Bottle feeding 0–23 months	Percentage of children age 0–23 months who were fed from a bottle with a nipple during the previous day Number of children age 0–23 months	22.2 3,597

¹ Includes children born in the 2 years preceding the survey regardless of whether the children are living or dead at the time of interview

Table 11.10 Micronutrient supplementation and deworming among children

Among children age 6–59 months, percentage who were given iron tablets or syrup, micronutrient powders, and iron-containing supplements in the past 7 days and percentage who were given vitamin A supplements in the past 6 months, and among children age 12–59 months, percentage who were given deworming medication in the past 6 months, according to background characteristics, Bangladesh DHS 2022

Background characteristic	Among children age 6–59 months:				Among children age 12–59 months:	
	Percentage given iron tablets or syrup in past 7 days ¹	Percentage given micronutrient powders in past 7 days ¹	Percentage given iron-containing supplements in past 7 days ^{1,2}	Percentage given vitamin A supplements in past 6 months ¹	Number of children	Percentage given deworming medication in past 6 months ^{1,3}

Key Findings

- **Employment and cash earnings:** More than one-third (37%) of currently married women age 15–49 were employed in the 12 months before the survey. Most employed women (92%) receive cash earnings, while 8% are not paid for their work. The proportion of employed women working for cash has increased by 9 percentage points since 2017–18.
- **Control over cash earnings:** Three in 10 currently married women with cash earnings make decisions independently on how their earnings will be used, while 61% decide jointly with their husband.
- **Ownership of assets:** 7% of ever-married women own a house alone, jointly with someone else, or both, and 5% own land alone and/or jointly. Most women who own a house or land have a title/deed and have their name on it.
- **Ownership and use of bank accounts, mobile phones, and national identification (NID) cards:** One-fifth of women age 15–49 have a bank account that they use, and 70% own a mobile phone. Thirty-seven percent of women have and use a bank account or used a mobile phone for financial transactions in the past 12 months. Most women (86%) have an NID card.
- **Participation in decision making:** 60% of women participate in three specified household decisions (regarding their own health care, household purchases, and visits to family or relatives) either alone or jointly with their husband, whereas 14% are not involved in any of the decisions.
- **Attitudes toward wife beating:** Overall, 14% of women agree that wife beating is justified for at least one of five specified reasons, a decline from 20% in 2017–18.

This chapter explores women's empowerment in terms of employment, earnings, and control over earnings. The chapter also examines women's ownership of assets, including houses, land, and phones, as well as their use of bank accounts and mobile-money-service providers. In addition, responses to specific questions are used to define two indicators of women's empowerment: women's participation in household decision making and women's attitudes towards wife beating.

12.1 MARRIED WOMEN'S EMPLOYMENT

Employment

Respondents are considered to be employed if they have done any work other than their housework in the 12 months before the survey.

Sample: Currently married women age 15–49

Earning cash for employment

Respondents are asked if they are paid for their labor in cash or in-kind. Only those who receive payment in cash only or in cash and in-kind are considered to earn cash for their employment.

Sample: Currently married women age 15–49 employed in the 12 months before the survey

Employment, particularly employment for cash, and control over how women use their earnings are considered important indicators of women's empowerment. More than one-third (37%) of currently married women age 15–49 were employed in the 12 months before the survey (**Table 12.1**). Most employed women (92%) receive cash earnings (including cash only and cash and in-kind), while 8% are not paid for their work. Married women's employment increases from 15% among those age 15–19 to 45% among those age 35–39 and then declines among those in older age groups (**Table 12.1** and **Figure 12.1**).

Trends: The proportion of married women age 15–49 who were employed in the 12 months before the survey declined from 49% in 2017–18 to 37% in 2022. At the same time, the percentage of employed women working for cash (including cash and in-kind payments) increased from 83% in 2017–18 to 92% in 2022.

12.2 CONTROL OVER WOMEN'S EARNINGS

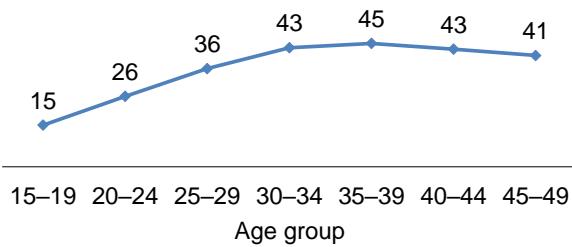

Control over one's own cash earnings

Respondents are considered to have control over their own earnings if they participate in decisions alone or jointly with their spouse about how their earnings will be used.

Sample: Currently married women age 15–49 who received cash earnings for employment during the 12 months before the survey

Figure 12.1 Employment by age

Percentage of currently married women who were employed at any time in the 12 months before the survey

An important indicator of women's empowerment is whether they have control over their own earnings. To assess control over earnings, currently married women age 15–49 who received cash earnings for their work in the 12 months preceding the survey were asked about who decides how their earnings are used. In Bangladesh, 3 in 10 married women who receive cash earnings for employment make decisions independently on how their earnings are used, whereas 61% participate in decision making jointly with their husband. Only 8% of women reported that their husband mainly decides on the use of their cash earnings (**Table 12.2.1** and **Figure 12.2**).

Patterns by background characteristics

- The percentage of currently married women who make decisions jointly with their husband on how their earnings are used increases from 54% among women age 15–19 to 64% among women age 40–44 before decreasing to 59% after age 44. Younger women age 15–19 are more likely to report that their husband mainly decides on the use of their earnings (14%) than women in older age groups (**Table 12.2.1**).
- The proportion of women who decide mainly on the use of their cash earnings is slightly higher in urban areas than rural areas (33% versus 29%). Conversely, a higher percentage of rural women indicate that their husband decides alone on the use of their earnings (9% versus 5%).
- The percentage of women who mainly decide how their cash earnings are used is highest in Barishal (39%) and lowest in Rajshahi (20%).
- The proportion of women who mainly decide how to use their cash earnings increases with increasing education, from 25% among those with no education to 36% among those with a secondary education or higher. The opposite pattern is seen among women whose husband makes decisions on the use of their cash earnings.
- Women from households in the lowest wealth quintile are less likely to be the main decision makers regarding the use of their earnings than women in the highest wealth quintile (26% versus 38%).

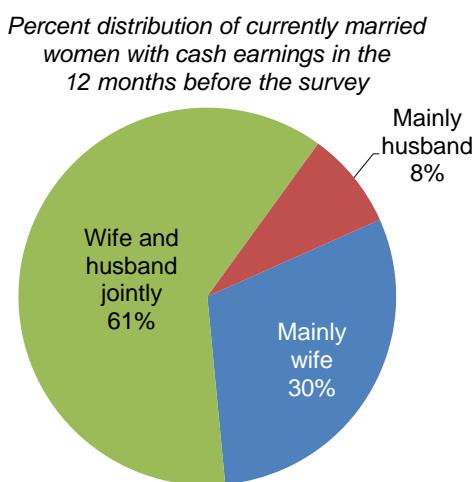

12.3 CONTROL OVER MEN'S EARNINGS

In Bangladesh, almost one-third of married women (29%) say that their husband decides how his earnings are used, while 65% report making such decisions jointly with their spouse. Only 4% of currently married women mainly decide how their husband's earnings are used (**Table 12.2.2**).

Patterns by background characteristics

- The percentage of currently married women who participate in decision making jointly with their husband on how their husband's earnings are used is highest among those age 35–44 (almost 70%). Younger women are more likely to report that their husband is the main decision maker on how his earnings are used (39%) (**Table 12.2.2**).
- A greater proportion of rural women (30%) than urban women (27%) report that their husband makes unilateral decisions regarding the use of his income.
- The proportion of women who jointly decide with their husband on the use of his earnings is highest in Rajshahi (72%) and lowest in Sylhet (55%).

Figure 12.2 Control over women's earnings

12.4 WOMEN'S OWNERSHIP OF ASSETS

12.4.1 Ownership of a House or Land and Documentation of Ownership

Ownership of a house or land

Respondents who own a house or land, whether alone or jointly with their spouse, someone else, or both their spouse and someone else.

Documentation of ownership of a house or land

Respondents whose name is on the title/deed or other government-recognized document.

Sample: Ever-married women age 15–49

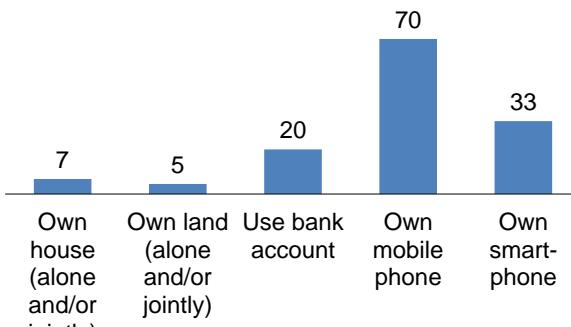

Patterns of house and land ownership among ever-married women age 15–49 according to their current marital status are presented in **Table 12.3**. In Bangladesh, 7% of women own a house alone, jointly with someone else, or both, and 5% own land alone and/or jointly (**Figure 12.3**). Among women who own a house, 62% have their name on the title/deed (**Table 12.4**). Similarly, among women who own land, 82% have their name on the title/deed (**Table 12.5**).

Patterns by background characteristics

- Ownership of a house increases with age. For instance, 3% of women age 15–19 own a house alone or jointly, as compared with 12% of women age 45–49 (**Table 12.4**). A similar pattern is observed regarding land ownership (1% versus 8%) (**Table 12.5**).
- Patterns of house ownership and land ownership are similar for women in urban and rural areas.
- The percentage of women who own a house is highest in Rangpur (8%) and lowest in Sylhet (3%). This trend is consistent for land ownership (6% versus 2%). Among women who own a house, the percentage with their name on the title/deed is highest in Sylhet (93%) and lowest in Chattogram (39%).
- The percentage of women who own a house and have their name on the title/deed is lowest among those from households in the second wealth quintile (55%). In contrast, the proportion of women who have their name on a title/deed for land is highest among those from households in the second wealth quintile (84%).
- Women from households in the lowest wealth quintile have a lower home ownership rate than women from households in the highest wealth quintile (5% versus 9%). The same pattern is observed for land ownership (3% versus 8%).

Figure 12.3 Ownership of assets

Percentage of ever-married women age 15–49 who:

12.4.2 Ownership and Use of Mobile Phones, Bank Accounts, and National Identification Cards

Use of bank accounts or mobile-money-service providers

Respondents who have and use a bank account or who used a mobile phone for financial transactions in the 12 months before the survey.

Sample: Ever-married women age 15–49

Women's ownership and use of a bank account and a mobile phone are considered as reflections of autonomy, social functioning, and financial independence. In Bangladesh, one-fifth of women age 15–49 have a bank account that they use, and 14% reported that they deposited or withdrew money from their account in the 12 months preceding the survey. Moreover, 70% of women own a mobile phone and 33% have a smartphone. Twenty-eight percent of women used their phone for financial transactions in the past 12 months. Overall, 37% of women have used either a bank account or a mobile phone for financial transactions in the past 12 months. Most women (86%) have a national identification (NID) card (**Table 12.6** and **Figure 12.3**).

Patterns by background characteristics

- The likelihood of women depositing or withdrawing money from their own bank account increases with increasing education, from 5% among those with no education to 25% among those with a secondary or higher education (**Table 12.6**). Similarly, women who have a secondary education or higher tend to use a mobile phone for financial transactions more often than those who have no education (39% versus 16%).
- The proportion of women who have and use a bank account or used a mobile phone for financial transactions in the past 12 months is highest in Dhaka (45%) and lowest in Rangpur (26%).
- Women from households in the highest wealth quintile are more likely to have used a mobile phone for financial transactions and to have deposited or withdrawn money from their own bank account in the past 12 months (39% and 29%, respectively) than women from households in the lowest quintile (19% and 2%, respectively).

12.5 PARTICIPATION IN DECISION MAKING

Participation in major household decisions

Women are considered to participate in household decisions if they make decisions alone or jointly with their husband in all three of the following areas: (1) their own health care, (2) major household purchases, and (3) visits to their family or relatives.

Sample: Currently married women age 15–49

Participation in household decision making is an important aspect of women's capacity to have control over their own lives. Overall, more than 7 in 10 women make decisions independently or jointly with their husband about their own health care and visits to their family or relatives, and 69% participate in decisions on major household purchases (**Table 12.7**). Three in five women participate in all three specific decisions either alone or jointly with their spouse, whereas 14% participate in none of the three decisions (**Table 12.8** and **Figure 12.4**).

Patterns by background characteristics

- The percentage of currently married women who participate in all three specified decisions increases from 39% among those age 15–19 to 67% among those age 40–44 but decreases slightly after age 44 (65%) (**Table 12.8**).
- Employed women who receive cash earnings are more likely to participate in all three decisions (66%) than unemployed women (56%) and those who are employed but not for cash (53%).
- Married women without children are less likely to participate in all three key decisions (43%) than their counterparts with one or more children (60% or higher).
- Participation of women in all three decisions is higher in urban areas than in rural areas (63% versus 58%).
- By division, the proportion of women who participate in all of the decisions is lowest in Sylhet (48%) and highest in Chattogram (65%).

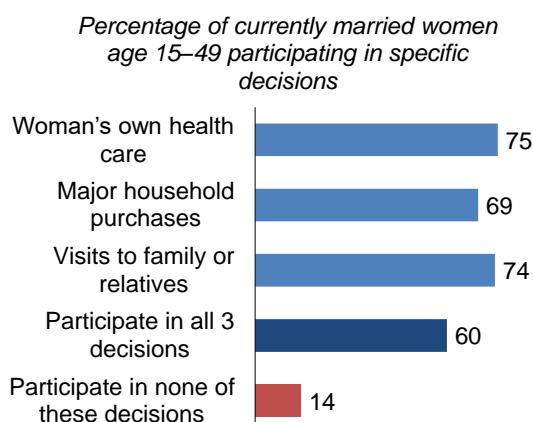

12.6 ATTITUDES TOWARD WIFE BEATING

Attitudes toward wife beating

Respondents are asked if they agree that a husband is justified in hitting or beating his wife under each of the following five circumstances: she burns the food, she argues with him, she goes out without telling him, she neglects the children, and she refuses to have sex with him. If respondents answer "yes" in at least one circumstance, they are considered to have attitudes justifying wife beating.

Sample: Ever-married women age 15–49

Figure 12.4 Women's participation in decision making

Another measure of women's empowerment derives from the idea that gender equity is essential, as beliefs justifying spousal violence can indicate lower status and undermine empowerment within households and relationships. In Bangladesh, 9% of ever-married women agree that wife beating is justified if a woman argues with her husband, 7% agree that it is justified if she neglects the children, and 6% agree that it is justified if she goes out without telling her husband. Only 3% of women think that wife beating is justified if the wife refuses to have sexual intercourse with her spouse, and 1% believe it is justified if she burns the food. Overall, 14% of women believe that a husband is justified in beating his wife for at least one of the five specific reasons (**Table 12.9** and **Figure 12.5**).

Trends: The proportion of ever-married women who agree that wife beating is justified for at least one of the five specified reasons has declined since 2017–18, from 20% to 14%.

Patterns by background characteristics

- Women's acceptance of wife beating increases as the number of living children increases. For example, 18% of women with five or more children think that wife hitting or beating is justified for at least one of the five specified reasons, as compared with 12% of women with no children (**Table 12.9**).
- A higher proportion of women in rural areas (15%) agree that a husband is justified in beating his wife for at least one reason than women in urban areas (12%).
- Attitudes justifying wife beating vary by division; 10% of women in Sylhet agree that wife beating is justified for at least one reason, compared with 17% of women in Rajshahi.
- Acceptance of wife beating among women decreases with increasing educational attainment, from 18% among women with no education to 9% among those with a secondary education or higher.
- Women from households in the lowest wealth quintile are more likely to believe that wife beating is justified for at least one specified reason (16%) than those from households in the highest quintile (10%).

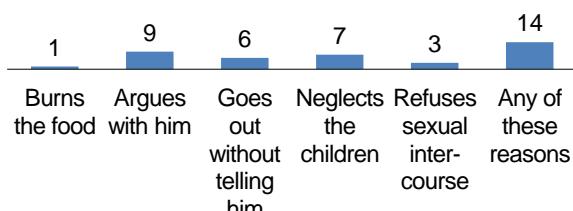

12.7 WOMEN'S EMPOWERMENT AND DEMOGRAPHIC AND HEALTH OUTCOMES

The two indicators of women's empowerment, namely women's participation in decision making and women's attitudes toward wife beating, can be summarized in two indices. The first index, which ranges in value from 0 to 3, shows the number of decisions in which women participate independently or jointly with their husband (see **Table 12.8** for the specific decisions). The second indicator, which ranges in value from 0 to 5, is the total number of reasons for which women agree that a husband is justified in hitting or beating his wife (see **Table 12.9** for the specific reasons). A higher score on the first indicator and a lower score in the second indicator are interpreted as reflecting a greater sense of entitlement and self-esteem and higher status for women.

Table 12.10 shows that women who participate in all three of the specified decisions are more likely to disagree with all of the specified reasons justifying wife beating than women who do not participate in any of the three decisions (88% versus 83%). Likewise, women who disapprove of all of the justifications for wife beating are more likely to participate in all three decisions (61%) than women who agree with all five reasons for wife beating (46%).

Figure 12.5 Attitudes towards wife beating

Percentage of women age 15–49 who agree that a husband is justified in beating his wife for specific reasons

Tables 12.11 to 12.13 show how women's contraceptive use, mean ideal number of children, unmet need for family planning, and reproductive health care vary by the two empowerment indicators. A woman's ability to control her fertility and use a method of contraception is likely to be affected by her own sense of empowerment. Almost two-thirds (65%) of women who participate in all three specified decisions use a contraceptive method, as compared with 60% of women who do not participate in any of the decisions (**Table 12.11**). Women who agree with all five of the reasons for which wife beating is justified have a higher rate of contraceptive use than those who do not agree with any of the reasons (71% versus 64%).

Unmet need for spacing declines as women's decision-making power increases, from 7% among women who do not make any of the three decisions to 4% among women who participate in all of the decisions (**Table 12.12**). The opposite pattern is observed in the case of unmet need for limiting. Women who agree with one or two reasons for which wife beating is justified are more likely to have an unmet need for limiting than those who agree with all five reasons (6% versus 3%).

Overall, women's access to antenatal care and delivery assistance from a medically trained provider increases as decision-making power increases (**Table 12.13**). For example, 84% of women who do not participate in any of the three specified decisions received antenatal care from a skilled provider, as compared with 89% of women who participate in all five decisions. Similarly, the percentage of women receiving antenatal and delivery care from a skilled provider increases as the number of reasons for which wife beating is justified decreases. For instance, 71% of women who do not justify wife beating for any reason received delivery care from a skilled provider, compared with 63% of women who justify wife beating for three or four reasons.

Although differences are minimal, child mortality is another demographic indicator that varies by women's empowerment. For example, postneonatal mortality declines from 7 deaths per 1,000 live births in the 5 years preceding the survey among women who do not participate in any of the three decisions to 5 deaths per 1,000 live births among women who participate in all three decisions (**Table 12.14**). Neonatal mortality is lower among women who disagree with all of the five reasons for which wife beating is justified (22 deaths per 1,000 live births) than among those who agree with one or two reasons (28 deaths per 1,000 live births). Similar findings are observed for infant mortality.

LIST OF TABLES

For more information on women's empowerment, see the following tables:

Key Findings

- Drinking water:** Household access to improved drinking water is almost universal (99%) in Bangladesh. However, only 1 in 10 households treat their drinking water using an appropriate method.
- Sanitation:** 80% of households have an improved sanitation facility, with a slight variation between urban (86%) and rural (78%) areas. Overall, 62% of the de jure population has basic sanitation, a proportion that has improved since 2017–18 (47%).
- Handwashing:** 57% of the population has a basic handwashing facility, an improvement of 18 percentage points from 2017–18 (39%).

The extent to which households have access to and use safe drinking water and sanitation facilities and engage in hygienic practices has profound implications for the health, safety, and overall well-being of the population. Water from improved sources is more likely to be safe for consumption since these sources safeguard against external pollution. This chapter presents information on source of drinking water, type of sanitation facility, and handwashing.

13.1 DRINKING WATER SOURCES, AVAILABILITY, AND TREATMENT

Improved sources of drinking water

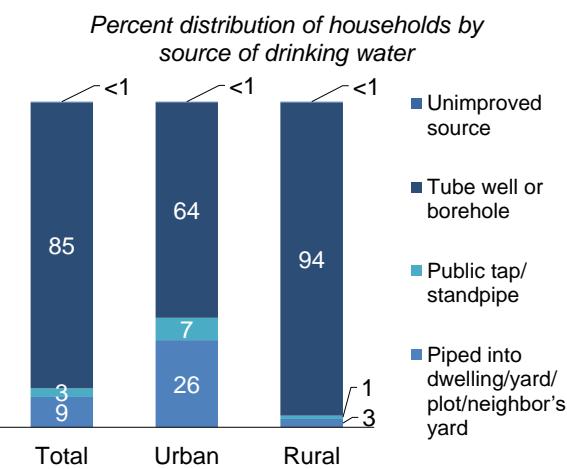

Include piped water, public taps, standpipes, tube wells, boreholes, protected dug wells and springs, rainwater, water delivered via a tanker truck or a cart with a small tank, and bottled water.

Sample: Households and de jure population

In Bangladesh, access to improved sources of drinking water is almost universal in both urban (99%) and rural (99%) areas (**Table 13.1.1**). Tube wells and boreholes are the most common source of improved drinking water (85%); however, there is substantial variation between urban and rural populations (64% versus 94%) in using this source of water (**Figure 13.1**).

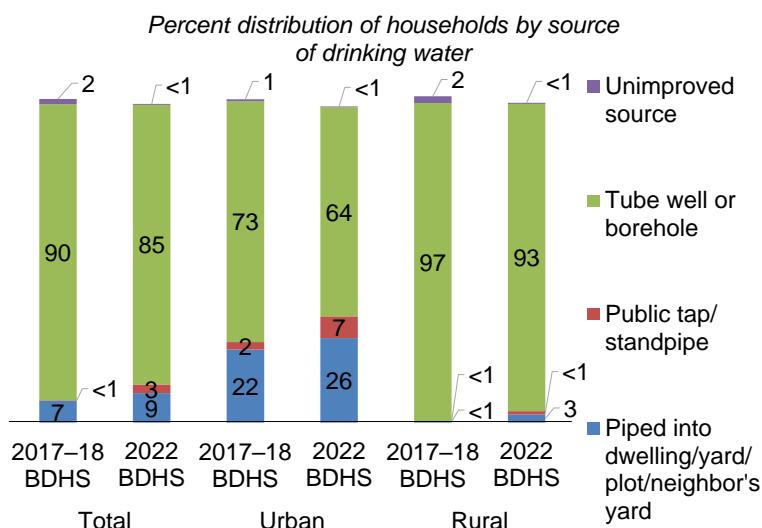

Although use of improved sources of drinking water is high in all of the administrative divisions, 3% of the population in Khulna and 4% in Sylhet still use unimproved sources (**Table 13.1.2**). Use of unimproved sources of drinking water is inversely related to household wealth; 2% of the population in the lowest wealth quintile uses water from an unimproved source, as compared with less than 1% of the population in the highest wealth quintile.

Figure 13.1 Household drinking water by residence

Trends: Between 2017–18 and 2022, the proportion of households obtaining their drinking water from a tube well or borehole decreased from 73% to 64% in urban areas and from 97% to 93% in rural areas, while the proportion of households obtaining drinking water through water piped into their dwelling/yard/plot, through water piped to a neighbor, or from a public tap/standpipe increased in both urban and rural areas over that same period (**Table 13.1.1** and **Figure 13.2**).

Figure 13.2 Trends in household drinking water by residence

Treatment of Drinking Water

The 2022 BDHS survey categorizes boiling, bleaching, filtering, and solar disinfecting as appropriate water treatment methods. In Bangladesh, only 10% of the population uses an appropriate water treatment method (**Table 13.2**). The percentage of the population that uses an appropriate water treatment method has remained unchanged since 2011.

Use of ceramic, sand, and other filters (6%) is the most common water treatment method practiced in Bangladesh, followed by boiling (5%). Use of an appropriate water treatment method is more prevalent in urban areas than rural areas (27% versus 4%). In urban areas, boiling is the most common water treatment method (17%), followed by the use of ceramic, sand, and other filters (13%). In rural areas, the most common water treatment method is ceramic, sand, and other filters (3%), followed by straining water through a cloth (1%).

By division, Dhaka has the highest percentage of households using an appropriate treatment method for drinking water (26%), while Mymensingh has the lowest percentage (1%).

Trends: The percentage of households using an appropriate water treatment method improved from 6% in 2007 to 10% in 2011 but has remained unchanged since then.

13.2 SANITATION

Improved sanitation facilities

Include flush/pour flush toilets that flush water and waste to a piped sewer system, septic tank, pit latrine, or unknown destination; ventilated improved pit (VIP) latrines; pit latrines with slabs; and composting toilets.

Sample: Households and de jure population

Use of improved sanitation facilities prevents people from coming into contact with human waste and helps reduce the transmission of water-borne diseases such as diarrhea, dysentery, and typhoid. In Bangladesh, 80% of households have an improved sanitation facility (86% in urban areas and 78% in rural areas). The most common type of toilet facility in rural areas is the pit latrine with a slab (33%), while in urban areas the most common facility is a flush/pour flush toilet that flushes to a septic tank (33%) (**Table 13.3.1**).

Although use of improved sanitation facilities has improved at the household level in all divisions, nearly one-fifth (19%) of the population still uses an unimproved sanitation facility. The percentage of households with unimproved sanitation facilities is highest in Mymensingh (31%) and lowest in Dhaka (14%). Among the divisions, Rangpur has the highest percentage of the population that still practices open defecation (3%) (**Table 13.3.2**).

Trends: There has been a 15% increase in the proportion of households with an improved sanitation facility from 2017–18 to 2022 (from 65% to 80%). The improvement can be seen in both urban areas (from 75% to 86%) and rural areas (from 62% to 78%). In Rangpur, the proportion of the de jure population practicing open defecation decreased from 7% in 2017–18 to 3% in 2022.

Sanitation Service Ladder

Sanitation service ladder	
Basic service	Use of improved facilities that are not shared with other households.
Limited service	Use of improved facilities shared by two or more households.
Unimproved	Use of pit latrines without a slab or platform, hanging latrines, or bucket latrines.
Open defecation	Disposal of human feces in fields, forests, bushes, open bodies of water, beaches, or other open spaces or with solid waste.
Sample:	De jure population

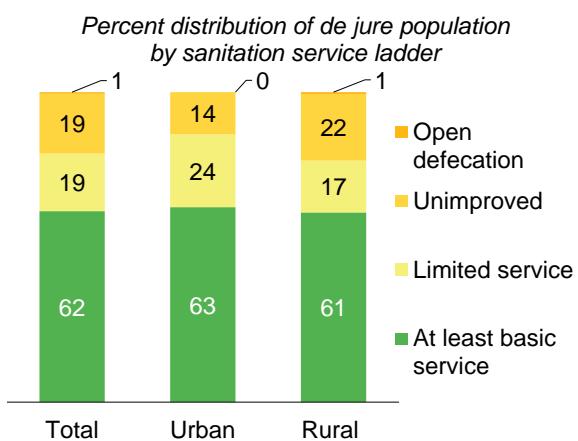

The Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (JMP) has devised a five-rung sanitation service ladder to benchmark and compare progress towards achieving SDG targets (WHO/UNICEF 2018).

Almost two-thirds (62%) of the population has at least basic sanitation service, while close to one-fifth (19%) has limited service. Nineteen percent of the population has an unimproved sanitation facility and 1% practices open defecation (**Table 13.4**).¹

Patterns by background characteristics

- There is a slightly higher proportion of households with basic sanitation service in urban areas than rural areas (63% versus 61%) (**Table 13.4** and **Figure 13.3**).
- Barishal (69%) has the highest proportion of the population with basic sanitation service, while Mymensingh (53%) has the lowest.
- Basic sanitation service is directly associated with wealth; 33% of the population in the lowest wealth quintile has basic sanitation service, as compared with 91% of the population in the highest wealth quintile.

Figure 13.3 Household population sanitation service by residence

13.3 HANDWASHING

Handwashing facilities

Basic

Availability of a handwashing facility on the premises with soap and water.

Limited

Availability of a handwashing facility on the premises without soap and water.

Sample: De jure population for whom a place for handwashing was observed or with no place for handwashing in dwelling, yard, or plot; excludes the de jure population for whom permission to see the facility was not granted

Handwashing is an important step in monitoring hygiene and preventing the spread of disease. Rather than asking direct questions on the practice of handwashing, which can be subject to overreporting, interviewers asked to see the place where members of the household most often washed their hands. A place for handwashing was observed for 99% of the de jure population. Of the handwashing places observed, 91% were in a fixed location and 8% were mobile (**Table 13.5**).

According to the definitions of handwashing facilities developed by the JMP, 57% of the population had a basic handwashing facility and 43% had a limited handwashing facility.

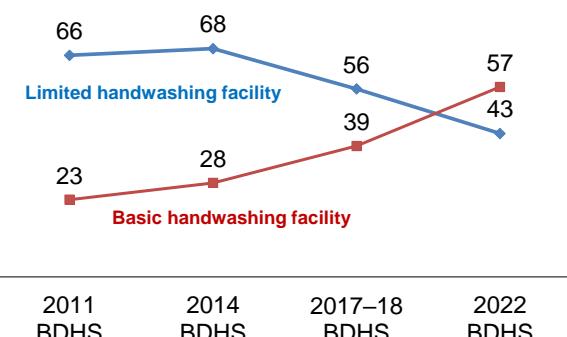

Trends: The percentage of the de jure population with a basic handwashing facility increased from 23% in 2011 to 57% in 2022 (**Figure 13.4**).

Patterns by background characteristics

- Basic handwashing facilities are more common in urban areas than rural areas (69% versus 52%) (**Table 13.5**).
- Dhaka and Rajshahi (62%) have the highest proportion of the de jure population with a basic handwashing facility, while Barishal (37%) has the lowest.
- Basic handwashing facilities are directly related to wealth; only 26% of the population in the lowest wealth quintile has basic handwashing facilities, as compared with 92% of the population in the highest wealth quintile.

Figure 13.4 Trends in access to basic and limited handwashing facilities

Percentage of the de jure population

¹ Soap includes soap or detergent in bar, liquid, powder, or paste form.

² Cleansing agents other than soap include locally available materials such as ash, mud, or sand.

³ The availability of a handwashing facility on premises with soap and water

⁴ The availability of a handwashing facility on premises without soap and/or water

BLOOD PRESSURE AND DIABETES

Key Findings

- **Hypertension:** Almost one-fourth (23%) of women and 17% of men in Bangladesh age 18 and above suffer from hypertension. Among those age 35 and older, 36% of women and 23% of men have hypertension.
- **Awareness of hypertension:** Four in every 10 women with raised blood pressure and half of hypertensive men are unaware of their elevated blood pressure level. Only 19% of hypertensive women and 20% of hypertensive men are aware of their condition, taking medication, and have their blood pressure under control.
- **Diabetes:** 17% of women and 15% of men age 18 and above suffer from diabetes. Among those age 35 and older, 23% of women and 19% of men have diabetes.
- **Awareness of diabetes:** Almost two-thirds of diabetic women (67%) and men (72%) are unaware of their elevated blood glucose level. A very low proportion of diabetic women (6%) and men (5%) are aware of their condition, taking medication, and have their blood glucose under control.

High blood pressure, or raised blood pressure, is a persistent medical condition in which the force of the blood against the artery walls is high enough to cause damage to the arteries, often resulting in health problems. This state—medically known as hypertension—is a major risk factor for cardiovascular and cerebrovascular diseases. Raised blood pressure or hypertension commonly goes undiagnosed in the early stages of the disease because the symptoms are often subtle and in accord with common health issues (WHO 2013). Additionally, hypertension is often inadequately controlled despite the availability of low-cost, efficacious blood pressure lowering medications.

The 2022 BDHS is the third Bangladesh DHS survey that has collected blood pressure and fasting blood glucose biomarker measurements. Prior to this, in 2011, the BDHS collected similar information among a subsample of women and men age 35 and older from one-third of the households selected in the survey. In the 2017–18 and 2022 BDHS surveys, biomarkers and relevant information were collected from all women and men age 18 and older in one-fourth of the households selected in the surveys. The biomarkers were collected to provide data on the prevalence of hypertension and diabetes. Information on management of hypertension and diabetes was also collected.

Periodic and updated national information on hypertension and diabetes is important for any country because these two illnesses are the precursors of many noncommunicable diseases (NCDs) that create a major public health challenge that threatens to destabilize social and economic development around the world (WHO 2010). Each year, NCDs take away 41 million lives globally, which is equivalent to 71% of all global deaths. Over 15 million people between age 30 and age 69 die from NCDs. Unfortunately, more than 85% of these deaths occur in low- and middle-income countries such as Bangladesh.

A national study on NCD risk factors revealed that 97% of the population age 18–69 had at least one risk factor: raised blood pressure, raised plasma blood glucose, higher body mass index (BMI), alcohol consumption, tobacco use, use of salt, low intake of fruits and vegetables, or inadequate physical activity

(WHO 2018). To meet this health challenge, the Government of Bangladesh has identified NCDs as a new and continuing challenge and has taken steps to prioritize the expansion of services related to NCD control activities in the 4th Health, Population and Nutrition Sector Program (4th HPNSP) 2017–2022 and the Strategic Investment Plan (SIP) for the 5th Health, Population and Nutrition Sector Program (2024–2029). According to the SIP, the “5th HPNSP needs to reduce NCD risks through expansion of promotive, preventive, curative and rehabilitative services and especially integrating NCD services at [primary health care] facilities both in rural and urban areas, adopting a life cycle approach.”

14.1 COVERAGE OF TESTING FOR BLOOD PRESSURE AND BLOOD GLUCOSE MEASUREMENT

In one-fourth of the households randomly selected for the 2022 BDHS survey sample, all women and men age 18 and older were eligible to participate in biomarker measurements, including blood pressure measurement, fasting plasma blood glucose testing, and height and weight measurements. **Table 14.1** shows that 8,156 women and 6,853 men age 18 and older were eligible for blood pressure and blood glucose measurements. Among those eligible, 95% of women and 91% of men were measured for blood pressure, and 92% of women and 89% of men were measured for blood glucose.

14.2 HYPERTENSION

Hypertension

Three blood pressure measurements were taken, and the average* of the second and third measurements was used to classify respondents according to internationally recommended categories (WHO 1999; WHO and ISH 2003).

Respondents were classified as having hypertension if they had a systolic blood pressure level of 140 mmHg or above or a diastolic blood pressure level of 90 mmHg or above at the time of the survey or were currently taking antihypertensive medication to control their blood pressure.

Blood pressure category	Systolic (mmHg)	Diastolic (mmHg)	
Optimal	<120	AND	<80
Normal	120–129	OR	80–84
High normal	130–139	OR	85–89
Level of hypertension			
Grade 1, mildly elevated	140–159	OR	90–99
Grade 2, moderately elevated	160–179	OR	100–109
Grade 3, severely elevated	180+	OR	110+

Note: Respondents whose blood pressure would fall in two different rows based on their systolic and diastolic levels were classified according to the highest blood pressure row into which they fell on either of the two measures.

* If only two measurements were available, the second measurement was used to classify the respondent as having hypertension; if only one measurement was available, it was used to classify the respondent.

Sample: Women and men age 18 and older with valid blood pressure measurements

Raised or high blood pressure is one of the risk factors for developing coronary heart disease, stroke, and kidney disease. The measurements taken for blood pressure in the 2022 BDHS were not intended to provide a medical diagnosis of the disease but, rather, to provide a cross-sectional assessment of the prevalence of high blood pressure in the population at the time of the survey. A LifeSource® UA-767 Plus blood pressure monitor was used for the measurements. This automatic device included separate cuffs for small, medium, and large arm circumferences.

14.2.1 High Blood Pressure Measurement

Overall, 87% of women and 68% of men age 18 and above reported having ever had their blood pressure measured by a doctor or other health care worker, and 15% of women and 10% of men reported having ever been told by a doctor or other health worker that they had high blood pressure or hypertension. Among those who had ever been informed that they had high blood pressure, 90% of women and 87% of men were prescribed medication to control their blood pressure, and 72% of women and 70% of men reported that they were taking the medication (**Table 14.2.1** and **Table 14.2.2**).

Trends: The percentage of women age 18 and older who had their blood pressure measured prior to the survey increased slightly from 83% in 2017–18 to 87% in 2022. Among men age 18 and older, the percentage rose from 65% to 68% over the same period.

14.2.2 Blood Pressure Status

Twenty-three percent of Bangladeshi women age 18 and older have hypertension; among men, the prevalence is 17% (**Table 14.3.1** and **Table 14.3.2**).

Trends: The prevalence of hypertension among women age 18 and older dropped from 28% in 2017–18 to 23% in 2022. Among men, the prevalence declined from 26% in 2017–18 to 17% in 2022 (**Figure 14.1**).

Patterns by background characteristics

- The prevalence of hypertension is higher among older women (age 35 and older) (36%) than among younger women (age 18–34) (8%). A similar age-related pattern is seen among Bangladeshi men (23% versus 6%) (**Table 14.3.1** and **Table 14.3.2**).
- Among both women and men age 18 and older, the prevalence of hypertension increases with increasing BMI. Obese women have a higher prevalence of hypertension than women with a normal BMI (42% versus 19%). The pattern is similar among men (43% versus 15%) (**Figure 14.2**).
- Across divisions, the prevalence of hypertension among women age 18 and older ranges from 20% in Dhaka to 28% in Rajshahi. Among men, the prevalence ranges from 10% in Mymensingh to 20% in Khulna.
- Among women age 18 and older, there is a clear inverse relationship between educational level and hypertension prevalence. The percentage of women with hypertension is highest among those with no education (37%) and lowest among those with a secondary education or higher (13%). This pattern is not observed among men.

Figure 14.1 Trend in prevalence of hypertension among adults age 18 and older

Percentage of women and men age 18+ with hypertension

■ Women ■ Men

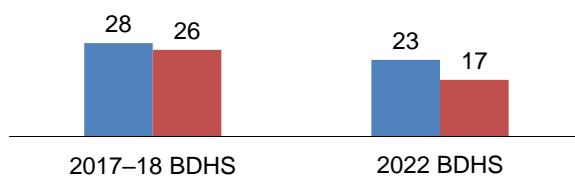

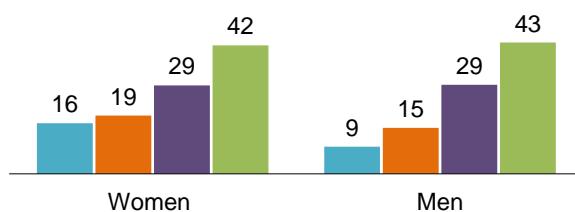

Figure 14.2 Hypertension and nutritional status

Percentage of women and men age 18+ with hypertension by nutritional status

■ Thin ■ Normal ■ Overweight ■ Obese

- The prevalence of hypertension is lower among women and men in the lowest wealth quintile (20% and 11%, respectively) than among women and men in the highest wealth quintile (27% each).

14.2.3 Awareness of, Medication for, and Control of Hypertension

Controlled hypertension

Controlled hypertension is defined as having a systolic blood pressure level below 140 mmHg and a diastolic blood pressure level below 90 mmHg and currently taking antihypertensive medication.

Sample: Women and men age 18 and above

The first step for individuals to bring their blood pressure under control is to be aware of their condition. Data on levels of awareness and treatment status among hypertensive women and men are presented in **Figure 14.3**. Forty-three percent of hypertensive women are not aware that they have elevated blood pressure. Only 19% are aware of their condition, reported taking medicine, and had their blood pressure within the normal range at the time of the survey. More than half of hypertensive men are not aware that they have elevated blood pressure (51%). Twenty percent are aware of their condition, reported taking medicine, and had their blood pressure within the normal range at the time of the survey.

Figure 14.3 Awareness of hypertension and treatment status

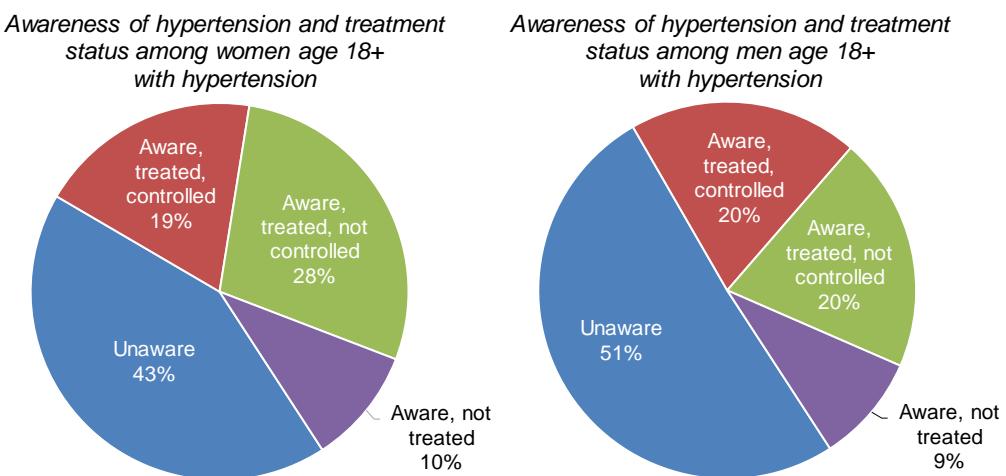

Table 14.4.1 and **Table 14.4.2** show the prevalence of controlled hypertension. Among women age 18 and older diagnosed with hypertension, 19% have controlled hypertension. Among men, the percentage is 20%.

Trends: The percentage of respondents age 18 and older with hypertension who were unaware of their condition decreased between 2017–18 and 2022, from 51% to 43% among women and from 67% to 51% among men.

Patterns by background characteristics

- The prevalence of controlled hypertension increases with age among both women and men. Among women, 20% of those age 35 and older with hypertension have controlled blood pressure, as compared with only 14% of those age 18–34. Similarly, 21% of men age 35 and older with hypertension have controlled blood pressure, compared with 10% of men age 18–34 (**Table 14.4.1** and **Table 14.4.2**).
- Among hypertensive women, those living in urban areas are more likely to have controlled blood pressure than those living in rural areas (22% versus 18%). A similar pattern is observed among men (23% versus 18%).

- By division, the prevalence of controlled hypertension among women ranges from 13% in Rajshahi to 27% in Sylhet. Among men, controlled hypertension ranges from 11% in Rajshahi to 30% in Sylhet.
- The prevalence of controlled hypertension among women generally increases with increasing education. Sixteen percent of women with no education have controlled hypertension, as compared with 29% of those with a secondary education or higher. This pattern is not seen among men.
- The prevalence of controlled hypertension is higher among women in the highest wealth quintile (26%) than among those in the other wealth quintiles (15%–21%). The prevalence among men is lowest in the second wealth quintile (10%) and highest in the highest wealth quintile (28%) (**Figure 14.4**).

14.3 DIABETES

Diabetes/raised blood glucose

Individuals were considered as having raised blood glucose or diabetes if they had a fasting blood glucose equivalent level of 7 mmol/L or above at the time of the survey or reported currently taking prescribed medication for their high blood glucose or diabetes.

Sample: Women and men age 18 and older

Diabetes has serious consequences for individuals and poses a large burden on health service systems, especially in developing countries such as Bangladesh (IDF 2019). For this report, blood glucose cutoffs were taken from the World Health Organization classification scheme (WHO 2006a). A fasting plasma glucose value greater than or equal to 7.0 mmol/L is classified as diabetes.

The data are presented according to respondents' fasting plasma glucose values. The fasting plasma glucose measurements taken in the survey provide a cross-sectional assessment of the prevalence of diabetes in the surveyed population at the time of the 2022 BDHS interviews and do not represent a medical diagnosis of diabetes. Respondents were asked not to eat or drink anything other than plain water for at least 8 hours prior to testing. The HemoCue 201 RT analyzer was used to display blood glucose measurements in milligrams per deciliter (mg/dl). This unit of measurement was converted into millimoles per liter (mmol/L) to maintain consistency with the units used in past surveys. In the survey setting, an individual's fasting plasma glucose was taken for 1 day only, and the value was recorded to provide information on the national status of this important NCD.

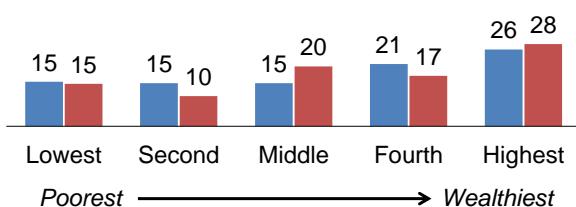

14.3.1 Diabetes Measurement

Table 14.5.1 and **Table 14.5.2** show that 37% of women and 25% of men age 18 and older had their blood glucose measured prior to the survey. Women age 35 and older are more likely to have received a blood glucose screening (44%) than women age 18–34 (28%). A similar pattern is seen among men (33% versus 11%). Only 6% of women and 4% of men were ever told that they had diabetes. Among respondents told they had high blood glucose diabetes by a doctor or other health worker, 74% each of women and men are currently taking prescribed medication.

Figure 14.4 Controlled hypertension by household wealth

Percentage of women and men age 18+ with controlled hypertension

■ Women ■ Men

Trends: The percentage of women age 18 and older who had their blood glucose measured prior to the survey increased from 26% in 2017–18 to 37% in 2022. Among men age 18 and older, the percentage rose from 21% to 25% over the same period.

14.3.2 Prevalence of Diabetes

According to the 2022 BDHS results, 17% of women age 18 and older in Bangladesh are diabetic (**Table 14.6.1**). Twelve percent of women age 18 and older have elevated plasma glucose levels but are not taking medications. Fifteen percent of men age 18 and older are diabetic, and 12% have elevated plasma glucose levels but are not taking medications (**Table 14.6.2**).

Trends: The prevalence of diabetes among women age 18 and older increased from 10% in 2017–18 to 17% in 2022 (**Figure 14.5**). Similarly, among men age 18 and older, diabetes prevalence rose from 11% in 2017–18 to 15% in 2022.

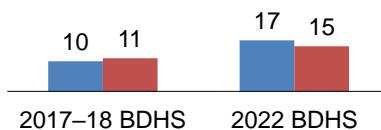

Patterns by background characteristics

- The prevalence of diabetes increases with age among both women and men. Among women, 23% of those age 35 and older have diabetes, as compared with 9% of those women age 18–34. Similarly, 19% of men age 35 and older have diabetes, compared with 8% of men age 18–34 (**Table 14.6.1** and **Table 14.6.2**).
- Obese women have a higher prevalence of diabetes than women with a normal BMI (32% versus 14%). The pattern is similar among men (22% versus 15%).
- The prevalence of diabetes is higher in urban areas than rural areas among both women (24% versus 14%) and men (21% versus 13%).
- Across divisions, the percentage of women with diabetes ranges from 12% in Mymensingh and Rajshahi to 23% in Dhaka. Among men, the prevalence ranges from 10% in Mymensingh to 20% in Dhaka.

Figure 14.5 Trends in prevalence of diabetes among adults age 18 and older

Percentage of women and men age 18+ with diabetes

■ Women ■ Men

- Women in the highest wealth quintile have a diabetes prevalence of 26%, over twice that of women in the lowest wealth quintile (11%). A similar disparity is observed among men (25% versus 10%) (**Figure 14.6**).

14.3.3 Awareness of, Medication for, and Control of Diabetes

Figure 14.7 presents data on levels of awareness and treatment status among diabetic women and men. Almost 7 in 10 diabetic women (67%) are not aware that they have elevated blood glucose, and only 6% are aware of their condition, reported taking medicine, and had their blood glucose within the normal range at the time of the survey. Seventy-two percent of diabetic men are not aware that they have elevated blood glucose, and only 5% are aware of their condition, reported taking medicine, and had their blood glucose within the normal range at the time of the survey.

Note: Table is based on respondents who consented to blood pressure measurement and those who consented to fasting blood glucose measurement.

Table 14.2.1 Blood pressure measured and medication prescribed to and taken by women

Percentage of women age 18 and above who have ever had their blood pressure measured by a doctor or other health care worker and percentage who have been told by a doctor or other health worker that they have high blood pressure or hypertension, and among women who have been told they have high blood pressure, percentage told in the past 12 months they have high blood pressure or hypertension, percentage prescribed medication to control their blood pressure, and percentage taking medication to control their blood pressure, according to background characteristics, Bangladesh DHS 2022

Background characteristic	Percentage who ever had blood pressure measured by a doctor or other health worker	Percentage ever told they have high blood pressure or hypertension by a doctor or other health worker	Number of women	Among women who have been told by a doctor or other health worker they have high blood pressure or hypertension, percentage who were:			Number of women
				Told in the past 12 months they have high blood pressure or hypertension	Prescribed medication to control their blood pressure	Taking medication to control their blood pressure

Highest	49.7	19.7	10.7	14.1	4.5	1.4	100.0	7.1	27.0	1,637
Total	51.4	18.7	11.0	12.7	4.3	1.9	100.0	4.4	23.3	7,724

Note: When a respondent's SBP and DBP fell into different classification categories, the respondent was grouped in the higher blood pressure classification. If blood pressure was measured three times, the average of the second and third blood pressure measurements was used to classify individuals with respect to hypertension. If the third blood pressure measurement was missing, the second measurement was considered the average. If the second and the third blood pressure measurements were missing, the first measurement was considered the average. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

SBP = systolic blood pressure

DBP = diastolic blood pressure

¹ Individuals were classified as having hypertension if, at the time of the survey, they had an average SBP level of 140 mmHg or above or an average DBP level of 90 mmHg or above or were currently taking antihypertensive medication. The term hypertension as used in this table is not meant to represent a clinical diagnosis of the disease; rather, it provides a statistical description of the survey population at the time of the survey.

² Nutritional status is defined using body mass index (BMI) for women age 20–49 and BMI-for-age for women age 15–19 as presented in Tables 11.11.1 and 11.11.2.

Table 14.3.2 Blood pressure status of men

Among men age 18 and above, percent distribution of blood pressure values, percentage having normal blood pressure and taking antihypertensive medication, and prevalence of hypertension, according to background characteristics, Bangladesh DHS 2022

Background characteristic	Classification of blood pressure							Normal blood pressure and taking antihypertensive medication	Prevalence of hypertension ¹	Number of men
	Optimal (SBP <120 and DBP <80 mmHg)	Normal (SBP 120–129 and DBP 80–84 mmHg)	High normal (SBP 130–139 and DBP 85–89 mmHg)	Mildly elevated (Grade 1) (SBP 140–159 or DBP 90–99 mmHg)	Moderately elevated (Grade 2) (SBP 160–179 or DBP 100–109 mmHg)	Severely elevated (Grade 3) (SBP 180+ or DBP 110+ mmHg)	Total

Total	52.5	22.8	11.1	9.6	2.9	1.1	100.0	3.3	16.9	6,242

Note: When a respondent's SBP and DBP fell into different classification categories, the respondent was grouped in the higher blood pressure classification. If blood pressure was measured three times, the average of the second and third blood pressure measurements was used to classify individuals with respect to hypertension. If the third blood pressure measurement was missing, the second measurement was considered the average. If the second and the third blood pressure measurements were missing, the first measurement was considered the average. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

SBP = systolic blood pressure

DBP = diastolic blood pressure

¹ Individuals were classified as having hypertension if, at the time of the survey, they had an average SBP level of 140 mmHg or above or an average DBP level of 90 mmHg or above or were currently taking antihypertensive medication. The term hypertension as used in this table is not meant to represent a clinical diagnosis of the disease; rather, it provides a statistical description of the survey population at the time of the survey.

² Nutritional status is defined using body mass index (BMI) for men age 20–49 and BMI-for-age for men age 15–19 as presented in Tables 11.11.3 and 11.11.4.

Note: The HemoCue Glucose 201 DM plasma conversion system automatically converted the fasting whole blood glucose measurements taken in the survey to fasting plasma glucose equivalent values. These estimates provide a cross-sectional assessment of fasting plasma glucose equivalent values in the surveyed population at the time of the BDHS interviews. Prevalence of raised FPG does not represent a clinical diagnosis of diabetes as FPG alone is not used for a clinical diagnosis.

¹ Individuals were classified as having diabetes if they reported taking medication for diabetes or had a fasting blood glucose of ≥7.0 mmol/L.

² There were no cases of men with hypoglycemia taking prescribed medication.

³ Nutritional status is defined using body mass index (BMI) for men age 20–49 and BMI-for-age for men age 15–19 as presented in Tables 11.11.3 and 11.11.4.

Key Findings

- **Prevalence of symptoms of anxiety according to a standard definition:** One in five women age 15–49 have symptoms of anxiety (GAD-7 scores of 6 or higher).
- **Prevalence of symptoms of depression according to a standard definition:** 5% of women age 15–49 have symptoms of depression (PHQ-9 scores of 10 or higher).
- **Diagnosis of anxiety or depression:** 7% of women were ever told by a health care provider that they had anxiety, and 4% were ever told that they had depression.
- **Treatment:** 6% of women with symptoms of anxiety took medicine prescribed by a health care provider for depression or anxiety in the 2 weeks preceding the survey; 10% of women with symptoms of depression took such medicine.
- **Care seeking and providers:** 12% of women who reported experiencing any symptoms of anxiety or depression in the 2 weeks preceding the survey reported that they had ever sought help.

Mental health is an integral component of overall health and well-being. Globally, approximately one in eight people experience a mental disorder, with anxiety disorders and depression ranking among the most prevalent mental health issues (Risal 2011; WHO 2022). In Bangladesh, barriers such as lack of awareness, persisting stigma, discrimination against mental health issues, and limited service accessibility hinder people from seeking proper care. Various screening tools exist to assess mental health conditions at a societal level. The 2022 BDHS included a module on mental health encompassing two widely used tools to screen for symptoms of anxiety and depression along with questions on care seeking and treatment.

To evaluate symptoms of anxiety, the Mental Health Module incorporates the Generalized Anxiety Disorder 7 scale (GAD-7), a set of seven items designed to assess the primary characteristic of anxiety: persistent and impairing worry (Spitzer et al. 2006a). In addition, the GAD-7 captures attributes related to three other common anxiety disorders: panic disorder, social anxiety disorder, and posttraumatic stress disorder. The scale demonstrates strong reliability and as well as criterion, construct, factorial, and procedural validity (Spitzer et al. 2006b). Furthermore, it exhibits an 89% sensitivity and 82% specificity in detecting general anxiety disorder through a threshold score of 10 (Kroenke et al. 2007).

To assess symptoms of depression, the module includes nine items from the Patient Health Questionnaire, or PHQ-9 (Kroenke and Spitzer 2002). The questions in the PHQ-9 are based on the *Diagnostic and Statistical Manual of Mental Disorders (DSM)* criteria for diagnosis of depression (American Psychiatric Association 2013). The PHQ-9 is a reliable and valid measure of depression severity. A score of 10 or more has a sensitivity of 88% and a specificity of 88% for major depression (Kroenke et al. 2001).

Both scales focus on symptoms experienced in the 2 weeks preceding the survey. Severity of symptoms for both tools is depicted using a Likert scale in which scores of 0, 1, 2, and 3 are assigned to the response categories “not at all” (never), “several days” (rarely), “more than half the days” (often), and “nearly every day” (always), respectively. A total score is generated by adding the scores of individual items. In the 2022

BDHS, severity of symptoms was assessed using the validated Water Glass Pictorial Scale, whereby an empty glass indicates “never,” a glass one-fourth filled indicates “rarely,” a half-filled glass indicates “often,” and a glass three-fourths filled indicates “always.” This visual chart was helpful in capturing the perceptions of respondents and contextualizing reported severity of symptoms; diagnostic screening was not performed.

Upon completion of the Mental Health Module, respondents who had a score of 10 or higher on the PHQ-9 and/or answered “rarely,” “often,” or “always” on the PHQ-9 suicidal ideation question were provided with a referral for mental health services.

15.1 SYMPTOMS OF ANXIETY

Table 15.1 shows the distribution of responses to each individual item in the GAD-7: (a) feeling nervous, anxious, or on edge; (b) not being able to stop or control worrying; (c) worrying too much about different things; (d) trouble relaxing; (e) being so restless that it is hard to sit still; (f) becoming easily annoyed or irritable; and (g) feeling afraid as if something awful might happen.

The most common symptoms of anxiety that women experienced “often” or “always” were feeling nervous anxious or on edge (11%), worrying too much about different things (8%), and becoming irritable (6%).

Severity of Symptoms of Anxiety

GAD-7 score

The sum of the scores on each of the seven items in the GAD-7 forms the overall score. Each symptom in the GAD-7 is assigned a score of 0, 1, 2, or 3 depending on how frequently the respondent reported experiencing that symptom in the 2 weeks preceding the survey:

0 – Never

1 – Rarely

2 – Often

3 – Always

GAD-7 scores range from a minimum of 0 to a maximum of 21. Higher scores are associated with more severe symptoms of anxiety.

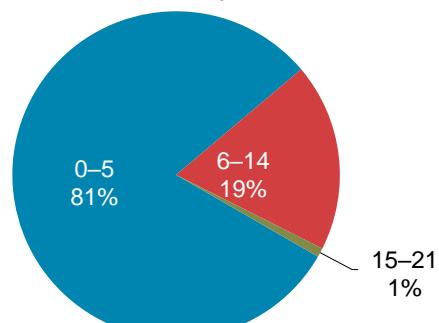

Sample: Ever-married women age 15–49

A GAD-7 score of 0–5 is considered mild, while a score of 6–14 is considered moderate and 15–21 is considered severe (Spitzer et al. 2006b). Nineteen percent of women age 15–49 had a GAD score of 6–14, and 1% of women had a score of 15–21 (**Figure 15.1**). Combined, 20% of women had a GAD score of 6 or more and 81% had a score of 0–5.

For the purpose of international comparison, in this report respondents age 15–49 are considered to have symptoms of anxiety if their GAD-7 score is 6 or higher. Overall, 20% of ever-married women reported experiencing symptoms of anxiety in the 2 weeks preceding the survey (**Table 15.2**).

Figure 15.1 Severity of anxiety (GAD-7)

Percent distribution of ever-married women age 15–49

Note: Values in figure may not add up to 100% due to rounding.

Patterns by background characteristics

- The likelihood of experiencing symptoms of anxiety increases with age. Twenty-six percent of women in the 45–49 age group reported having symptoms of anxiety, as compared with 13% of those in the 15–19 age group.
- By division, the percentage of women who reported experiencing symptoms of anxiety is highest in Rangpur (26%).
- Women with no education reported experiencing symptoms of anxiety more frequently than those with a secondary education or higher (27% and 14%, respectively) (**Figure 15.2**).
- Similarly, women in the lowest wealth quintile reported a higher incidence of anxiety symptoms than those in the highest wealth quintile (22% versus 16%).

15.2 SYMPTOMS OF DEPRESSION

Table 15.3 shows the distribution of responses to each individual item in the PHQ-9: (a) little interest or pleasure in doing things; (b) feeling down, depressed, or hopeless; (c) trouble falling asleep or staying asleep or sleeping too much; (d) feeling tired or having little energy; (e) poor appetite or overeating; (f) feeling bad about yourself or that you are a failure or have let yourself or your family down; (g) trouble concentrating on things such as reading the newspaper or watching television; (h) moving or speaking so slowly that other people could have noticed or the opposite (being so fidgety or restless that you have been moving around a lot more than usual); and (i) thoughts that you would be better off dead or of hurting yourself in some way.

The most common symptoms of depression that women reported having experienced “often” or “always” were feeling tired or having little energy (10%); trouble falling asleep or staying asleep or sleeping too much (9%); feeling down, depressed, or hopeless (6%); and poor appetite or overeating (6%). Eight percent of women said that they thought they would be better off dead or thought of hurting themselves in some way.

Severity of Symptoms of Depression

PHQ-9 score

The sum of the scores on each of the nine items in the PHQ-9 forms the overall score. Each symptom in the PHQ-9 is assigned a score of 0, 1, 2, or 3 depending on how frequently the respondent reported experiencing that symptom in the 2 weeks preceding the survey:

0 – Never

1 – Rarely

2 – Often

3 – Always

PHQ-9 scores range from a minimum of 0 to a maximum of 27. Higher scores are associated with more severe symptoms of depression.

Sample: Ever-married women age 15–49

Figure 15.2 Symptoms of anxiety by education

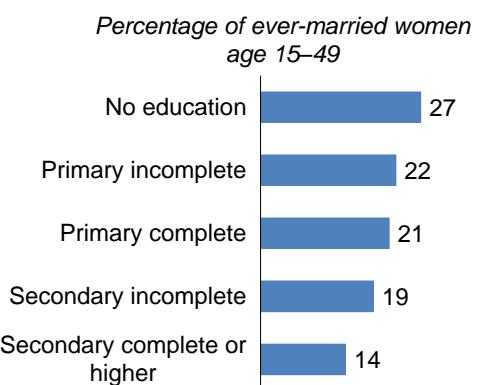

Table 15.4 shows the distribution of ever-married women according to the severity of symptoms of depression. A PHQ-9 score of 0–4 is considered minimal symptoms or no symptoms, a score of 5–9 is considered mild, 10–14 is considered moderate, 15–19 is considered moderately severe, and 20–27 is considered severe (Kroenke et al. 2001). Twenty-four percent of women age 15–49 had a PHQ-9 score of 5–9, and 4% had a score of 10–14 (**Figure 15.3**). Less than 2% of women had a PHQ-9 score of 15–19 or higher (**Figure 15.3**).

For international comparison, in this report respondents are considered to have symptoms of depression if their PHQ-9 score is 10 or higher. Overall, 5% of women age 15–49 reported experiencing symptoms of depression during the 2 weeks preceding the survey (**Table 15.4**).

Patterns by background characteristics

- Women age 45–49 more often reported experiencing symptoms of depression than those in other age groups (7%). Women age 20–24 reported the least occurrence of such symptoms (3%).
- By division, Rangpur has the highest proportion of women reporting symptoms of depression (8%), whereas Rajshahi has the lowest proportion (4%).
- Seven percent of women with no education reported experiencing symptoms of depression, as compared with 4% of women with a secondary education or higher (**Figure 15.4**).
- Similarly, women from the lowest wealth quintile more often reported experiencing depressive symptoms (6%) than their counterparts in the highest wealth quintile (4%).

Figure 15.3 Severity of depression (PHQ)

Percent distribution of ever-married women age 15–49

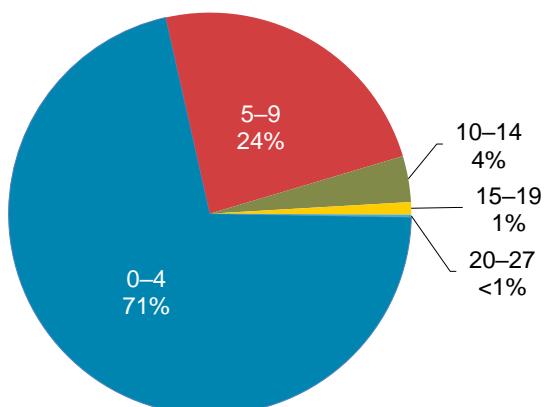

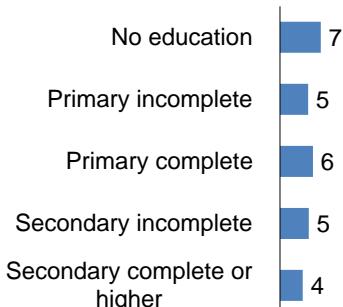

Figure 15.4 Symptoms of depression by education

Percentage of ever-married women age 15–49

15.3 TREATMENT FOR SYMPTOMS OF ANXIETY AND DEPRESSION

Regardless of their scores on the GAD-7 or PHQ-9, all respondents were asked (a) if a health care provider had ever told them that they had anxiety or depression and (b) if they had taken medicine in the 2 weeks before the survey that was prescribed by a health care provider for anxiety or depression.

Seven percent of ever-married women age 15–49 were ever told by a health care provider that they had anxiety, while 4% were ever told that they had depression. Two percent of ever-married women reported taking medicine prescribed by a health care provider for depression or anxiety in the past 2 weeks (**Table 15.5**).

Patterns by background characteristics

- Four percent of women age 15–19 were diagnosed by a health care provider with anxiety and 3% were diagnosed with depression, as compared with 11% and 6%, respectively, among women age 45–49. Women in the 45–49 age group were more likely to take medication for depression or anxiety (**Table 15.5**).
- Seventeen percent of women with a GAD-7 score of 6 or more were ever told by a health care provider that they had anxiety, and 11% were ever told they had depression. Six percent took medicine prescribed by a health care provider for depression or anxiety in the 2 weeks preceding the survey.
- Among women with symptoms of depression (PHQ-9 score of 10 or more), 21% were ever told by a health care provider that they had anxiety, and 15% were ever told that they had depression. Ten percent of women with a score of 10 or more took medicine prescribed by a health care provider for depression or anxiety in the 2 weeks before the survey.
- A higher proportion of women with no education were diagnosed with anxiety and depression by a health care provider (8% and 5%, respectively) than women with a secondary education or higher (6% versus 4%). However, women in the two groups were equally likely to be taking prescribed medication (2% each).

15.4 CARE SEEKING FOR SYMPTOMS OF ANXIETY AND DEPRESSION

Respondents who said that they had experienced any symptoms of anxiety or depression during the 2 weeks before the survey, regardless of frequency (that is, respondents with a score of 1 or higher on either the GAD-7 or PHQ-9), were asked if they had ever sought help. Twelve percent of ever-married women who experienced any symptoms of anxiety or depression in the 2 weeks preceding the survey reported seeking help (**Table 15.5**).

Patterns by background characteristics

- Twenty-one percent of women with symptoms of anxiety (GAD-7 score of 6 or more) have ever sought help, while 9% of women with a GAD-7 score of 0–5 have ever sought help (**Table 15.5**).
- Twenty-two percent of women with a PHQ-9 score of 10 or more have ever sought help, as compared with 11% of women with a PHQ-9 score of 0–9 (**Table 15.5**).
- By division, the percentage of women with symptoms of anxiety or depression who sought assistance is highest in Khulna (15%) and lowest in Barishal (6%).
- Women with no education are less likely to have sought help than those with a secondary education or higher (10% versus 12%).

15.5 SYMPTOMS OF ANXIETY OR DEPRESSION ADJUSTED FOR TREATMENT

People with anxiety or depression who are receiving treatment may experience fewer symptoms or no symptoms at all. To better understand the burden of anxiety and depression at the population level, including individuals whose symptoms may be effectively managed through treatment, **Table 15.6** shows the percentage of ever-married women who were experiencing symptoms of anxiety or depression and were receiving treatment from a health care provider, defined as taking medication prescribed for anxiety or depression within the past 2 weeks.

Twenty percent of women reported symptoms of anxiety or are taking anxiety medication prescribed by a health care professional, while only 7% of women reported symptoms of depression or are taking prescribed medication (**Table 15.6**).

Patterns by background characteristics

- Anxiety is most common among women in the 45–49 age group (27%) and less common among younger women. This trend is consistent for depression as well (**Table 15.6**).
- By division, women in Rangpur are most likely to exhibit both anxiety and depression symptoms (26% and 9%, respectively). Women in Dhaka are least likely to experience anxiety (18%), while women in Mymensingh are least likely to experience depression (5%).
- Women with no education have higher levels of both anxiety and depression (27% and 8%, respectively) than women with a secondary education or higher (15% and 5%, respectively).

LIST OF TABLES

¹ Respondents who had a score of 6 or higher on the GAD-7 or reported taking medicine prescribed by a doctor or other health care worker for anxiety during the past 2 weeks

² Respondents who had a score of 10 or higher on the PHQ-9 or reported taking medicine prescribed by a doctor or other health care worker for depression during the past 2 weeks

Key Findings

- **Causes of death among children under age 5:** Among children under age 5, the major causes of death are pneumonia (24%), prematurity (22%), birth asphyxia (19%), congenital abnormality (7%), drowning (6%), and possible serious infections (4%).
- **Causes of death among neonates:** The major causes of death among neonates are prematurity (32%), birth asphyxia (27%), pneumonia (22%), and congenital abnormality (7%).
- **Causes of death among children age 12–59 months:** The major causes of death among children age 12–59 months are drowning (46%) and pneumonia (12%).
- **Trends in cause-specific mortality rates:** Among children under age 5, mortality due to pneumonia decreased by 1 death per 1,000 live births between 2017–18 and 2022. However, mortality due to prematurity increased from 5 to 7 deaths per 1,000 live births.

Data on causes of death are crucial in health policy planning and program monitoring (WHO 2016c). Although cause of death estimates are useful in prioritizing interventions, the availability of such data is somewhat limited in resource-constrained settings, and this is particularly the case in Bangladesh. Verbal autopsy is a method of determining cause of death based on an interview with the next of kin or caregivers who were present at the time of death or who have knowledge about the events leading to the death. This method has been commonly used in settings with limited resources where the vital registration system is weak and the majority of deaths occur outside the reach of health services.

The 2022 BDHS adopted the verbal autopsy method for estimation of causes of death among children under age 5 in Bangladesh. Previously, verbal autopsies were conducted in the 1993–94 BDHS, 1996–97 BDHS, 2004 BDHS, 2011 BDHS, and 2017–18 BDHS. The 1993–94 BDHS, 1996–97 BDHS, and 2004 BDHS assigned causes of death using computer algorithms involving a hierarchical process that followed several mutually exclusive tiers applied in sequence, whereas the 2011 BDHS, 2017–18 BDHS, and 2022 BDHS used comparable instruments and assigned causes of death through physician reviews. Therefore, the 2022 BDHS cause of death results are more comparable to the 2011 BDHS and 2017–18 BDHS estimates than to those from the other surveys.

16.1 VERBAL AUTOPSY INSTRUMENTS

The 2022 BDHS verbal autopsy instruments were adapted from the standardized 2016 WHO, 2022 WHO, and 2017–18 BDHS instruments. Separate instruments were used for neonatal deaths (age 0–28 days) and child deaths (age 1–59 months). The questionnaires included both open-ended and closed-ended questions and gathered detailed information on signs and symptoms leading to death. Information was also collected on the antenatal history of the mother and health care received by the deceased child. The questionnaires were adapted to the local context and translated into Bengali, the most commonly spoken language in Bangladesh.

16.2 DATA COLLECTION METHODS

Each data collector received a month of training on the 2022 BDHS questionnaires. In addition, dedicated training was organized for the team responsible for conducting verbal autopsy interviews. The verbal autopsy team included one trained interviewer and one field editor from each of the 20 data collection teams. Supervisors and quality control officers also received the training to clarify their roles and duties. The training included extensive classroom lectures and role-playing sessions. At the end of the training, the data collectors were sent for practice in the field. The verbal autopsy instruments were updated based on feedback from the field practice.

Before the questionnaires were administered, informed consent was obtained from the mother or caregiver who was present at the time of death or who had knowledge about the events leading to the death. Efforts were made to maintain the privacy of respondents during interviews.

16.3 QUALITY ASSURANCE

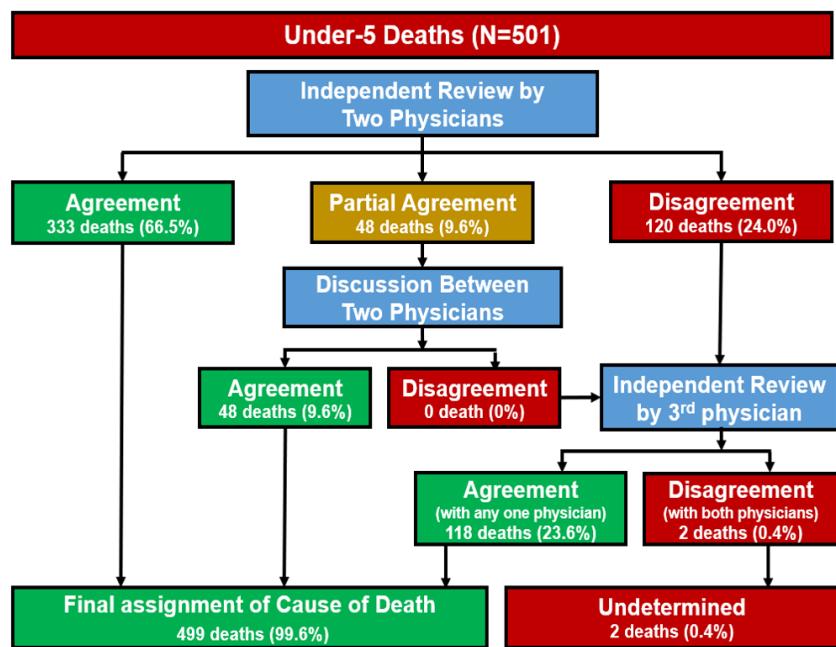

Six quality control officers were engaged as focal persons for quality assurance. The focal persons were extensively trained by the International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b) on the verbal autopsy instruments, the data collection process, interviewing techniques, and monitoring and supervision principles. During the fieldwork, the focal persons conducted on-site visits to supervise data collection and provide additional technical support when required. Additionally, periodic field monitoring and supervision were done by the 2022 BDHS core team, the quality control team, and representatives from the Ministry of Health and Family Welfare. Six separate review meetings, including an online meeting, were held with the verbal autopsy data collection team during the survey. At the conclusion of the survey, all of the completed Verbal Autopsy Questionnaires were reviewed by the research officer before data entry. Double entry was done by two separate data entry personnel to avoid inconsistencies.

16.4 CAUSE OF DEATH CERTIFICATION AND CODING

Three physicians were assigned to review the Verbal Autopsy Questionnaires and determine causes of death. The physicians received 4 weeks of training on the verbal autopsy instruments, International Classification of Diseases (10th revision) codes (WHO 2019), and cause of death assignment processes and standards. The training consisted of theoretical classes for 2 weeks and practice sessions for 2 weeks. During the practice sessions, the physicians reviewed completed Verbal Autopsy Questionnaires from the 2022 BDHS verbal autopsy pretest and 2017–18 verbal autopsy forms and assigned causes of death based on ICD-10 codes. After each practice session, a supervised discussion took place among the physicians to review process and logic for assigning causes of death.

In the 2022 BDHS, each questionnaire was independently reviewed by two physicians. The physicians were blinded regarding the order of the review. The process of blinding and reviewer allocation was maintained by an experienced statistician. The physicians assigned immediate, underlying, and contributory causes of death based on the ICD-10. When the two physicians agreed on the underlying cause, it was considered to be the final cause of death. In the absence of agreement, an additional review was conducted by a third physician. If the underlying cause was agreed upon by any two of the three physicians, it was considered the final cause of death. If no agreement was reached after the third physician review, the cause of death was recorded as “undetermined.” In 48 cases, two physicians assigned identical causes of death but disagreed on whether these were immediate or underlying causes. A discussion was arranged to reconcile the differences in the presence of a trained verbal autopsy expert. The review process is summarized with unweighted numbers in **Figure 16.1**.

Figure 16.1 Physician review process for verbal autopsies

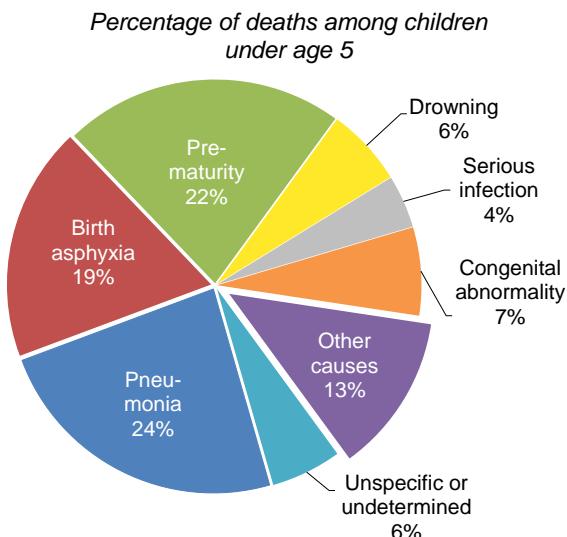

16.5 CAUSES OF DEATH AMONG CHILDREN UNDER AGE 5

Table 16.1 shows the percent distribution of deaths among children under age 5 in Bangladesh by cause of death, according to age group. Pneumonia (24%) is the most common cause of death, followed by premature birth (22%) and asphyxia (19%). Congenital abnormality (7%), drowning (6%), and possible serious infections (4%) are among other causes of death. Causes of death could not be ascertained in 6% of cases (5% because of a lack of adequate information and 1% because of a lack of agreement between the reviewing physicians) (Figure 16.2).

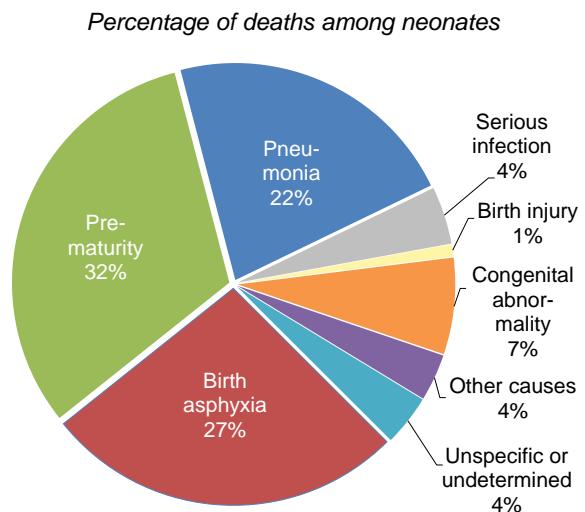

Among neonates (age 0–28 days), premature birth (32%) is the major cause of death. This is followed by birth asphyxia (27%), pneumonia (22%), and congenital abnormality (7%) (Figure 16.3).

Figure 16.2 Causes of death among children under age 5

Note: Other causes include birth injury, diarrhea, and other.

Figure 16.3 Causes of death among neonates

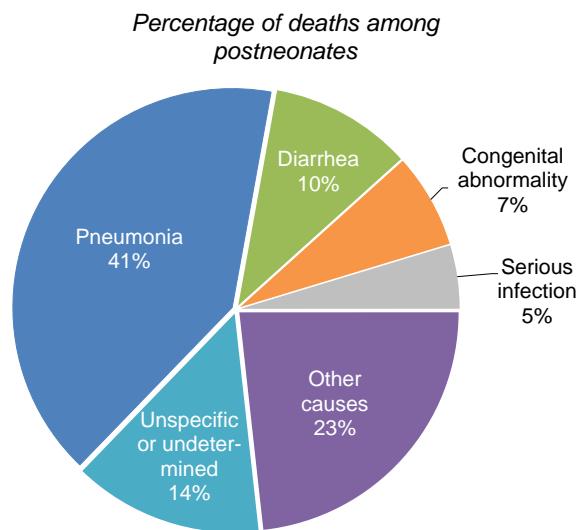

Note: Other causes include diarrhea and other.

Pneumonia accounts for 41% of deaths among children age 29 days to age 11 months. Additionally, diarrhea accounts for 10% of deaths among these children (**Figure 16.4**).

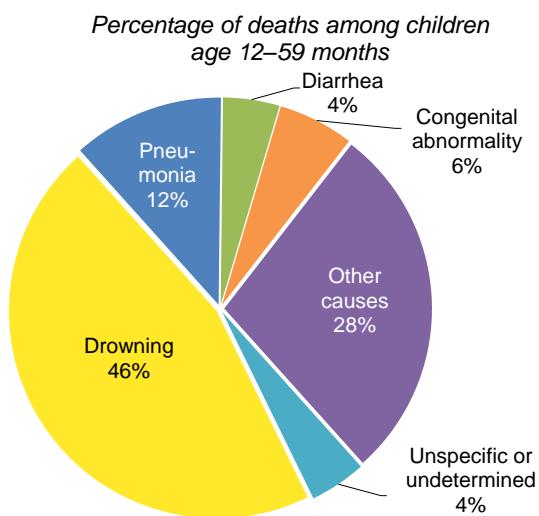

Among children age 12–59 months, 46% of deaths are due to drowning and 12% to pneumonia (**Figure 16.5**).

Figure 16.4 Causes of death among postneonates

Note: Other causes include premature birth and other.

Figure 16.5 Causes of death among children age 12–59 months

Note: Other causes include birth injury, possible serious infection, and other.

Patterns by background characteristics

- Twenty-three percent of deaths among male children are caused by pneumonia, 21% are caused by premature birth, and 21% are caused by birth asphyxia. Among female children, 25% of deaths are caused by pneumonia, 23% by premature birth, and 16% by birth asphyxia. Drowning is more prevalent among male children (8%) than female children (4%) (**Table 16.2**).
- Birth asphyxia accounts for 22% of deaths among children in urban areas, as compared with 18% among children in rural areas. Drowning is more prevalent in rural areas (7%) than urban areas (3%).
- Children whose mothers have at least some primary education (7%) face a higher risk of dying due to possible serious infections than children whose mothers have at least some secondary education (3%) (**Table 16.3**).
- In Chattogram, 16% of deaths among children under age 5 are attributable to pneumonia, compared with 34% in Sylhet. Drowning is most common in Chattogram (13%) and least common in Dhaka and Mymensingh (2%) (**Table 16.4**).

16.6 CAUSE-SPECIFIC MORTALITY RATES

The cause-specific mortality rate is calculated by applying the cause of death distribution in the survey to the estimated under-5 mortality rate. **Figure 16.6** shows cause-specific mortality rates per 1,000 live births for the 2017–18 BDHS and the 2022 BDHS. The mortality rate for pneumonia decreased from 8 deaths per 1,000 live births in the 2017–18 BDHS to 7 deaths per 1,000 live births in the 2022 BDHS. Similarly, mortality due to birth asphyxia decreased by 1 death per 1,000 live births. However, premature birth increased from 5 to 7 deaths per 1,000 live births during this period. Mortality rates for all other causes decreased between the 2017–18 BDHS and 2022 BDHS.

LIST OF TABLES

For more information on causes of death among children under age 5, see the following tables:

- **Table 16.1 Causes of death among children under age 5 by age group**
- **Table 16.2 Causes of death among children under age 5 by sex of child and residence**
- **Table 16.3 Causes of death among children under age 5 by mother's education**
- **Table 16.4 Causes of death among children under age 5 by division**

A.1 INTRODUCTION

This appendix describes the objectives of the survey, the overall sample size, and survey domains. The 2022 Bangladesh Demographic and Health Survey (2022 BDHS) is the ninth DHS survey conducted in Bangladesh, following those implemented in 1993–94, 1996–97, 1999–2000, 2003–04, 2007–08, 2010–11, 2014, and 2017–18. As with the prior surveys, the main objective of the 2022 BDHS is to provide up-to-date information on fertility and childhood mortality levels; fertility preferences; awareness, approval, and use of family planning methods; and maternal and child health, among other topics. All ever-married women age 15–49 who were usual members of the selected households and those who spent the night before the survey in the selected households were eligible to be interviewed in the survey. The survey is designed to produce representative results for the country as a whole, for urban and rural areas separately, and for each of the eight administrative divisions.

A.2 SAMPLE FRAME

The sampling frame used for the 2022 BDHS is the Integrated Multi-Purpose Sampling (IMPS) master sample. The IMPS is a master sample selected from a complete list of enumeration areas (EAs) covering the entire country prepared by the Bangladesh Bureau of Statistics for the 2011 population census of the People's Republic of Bangladesh. The sampling frame contains information about EA location, type of residence (city corporation, other than city corporation, or rural), and the estimated number of residential households. A sketch map that delineates the EA geographic boundaries is available for each EA.

Administratively, Bangladesh is divided into eight divisions. Each division is subdivided into progressively smaller units: zillas, thanas, unions, wards, and villages. An EA is a village, a group of small villages, or part of a large village. These divisions allow the country as a whole to be easily separated into small geographical units with urban-rural designations. Urban areas are further classified into two groups: city corporations and other than city corporations. **Table A.1.1** shows the percent distribution of households by division and type of residence according to the 2011 population census. Division size varies from 5.6% (Sylhet, the smallest division) to 25.8% (Dhaka, the largest division). In Bangladesh, 23.3% of households are in urban areas, 8.0% are in city corporations, and 15.3% are in other than city corporations.

Table A.1.1 Percent distribution of households by division and type of residence

Division	Type of residence			Division size (percentage)	
	Urban		Total		
	City corporation	Other than city corporation			
Barishal	3.9	12.3	16.2	83.8	100.0
Chittogram	9.9	15.3	25.1	74.9	100.0
Dhaka	19.0	19.7	38.7	61.3	100.0
Khulna	4.2	13.6	17.8	82.2	100.0
Mymensingh	0.0	14.4	14.4	85.6	100.0
Rajshahi	2.2	15.0	17.2	82.8	100.0
Rangpur	0.0	12.7	12.7	87.3	100.0
Sylhet	5.4	10.2	15.6	84.4	100.0
Bangladesh	8.0	15.3	23.3	76.7	100.0

Source: Sampling frame of the 2011 population census

Table A.1.2 presents the frequency distribution of EAs by division and by type of residence, according to the IMPS master sample.

Table A.1.2 Distribution of EAs by division and type of residence: IMPS master sample

Division	EAs				
	Urban		Total urban	Rural	Total
	City corporation	Other than city corporation			
Barishal	61	61	122	87	209
Chattogram	64	70	134	182	316
Dhaka	87	80	167	206	373
Khulna	61	63	124	131	255
Mymensingh	0	17	17	86	103
Rajshahi	61	66	127	156	283
Rangpur	61	61	122	138	260
Sylhet	61	61	122	91	213
Bangladesh	456	479	935	1,077	2,012

A.3 SAMPLE DESIGN AND IMPLEMENTATION

The 2022 BDHS sample was stratified and selected in two stages. Each division was stratified into urban city corporations, urban areas other than city corporations, and rural areas, yielding a total of 23 sampling strata. Samples of EAs were selected independently in each stratum in two stages. Implicit stratification and proportional allocation were achieved at each of the lower administrative levels by sorting the sampling frame within each sampling stratum before sample selection, according to administrative units in different levels, and by using a probability proportional to size selection at the first stage of sampling.

In the first stage, 675 EAs were selected with probability proportional to EA size and with independent selection in each sampling stratum. The sample allocation is given in **Table A.2**. A household listing operation was carried out in all of the selected sample EAs, and the resulting lists of households served as the sampling frame for the selection of households in the next stage. In the second stage of selection, a fixed number of 45 households per cluster were selected with an equal probability systematic selection from the newly created household listing. The survey interviewers interviewed only the preselected households. No replacements and no changes to the preselected households were allowed in the implementing stages in order to prevent bias. All ever-married women age 15–49 who are usual members of the selected households or who spent the night before the survey in the selected households were eligible to be interviewed.

Table A.3 shows the allocation of households according to division and type of residence, and **Table A.4** shows the expected number of completed interviews according to division and type of residence. To ensure that survey precision was comparable across divisions, the sample allocation was based on a power allocation between divisions and between different types of residences within each division. Based on a fixed sample take of 45 households per cluster, the survey selected 675 EAs, 237 in urban areas and 438 in rural areas. The survey was conducted in 30,375 residential households, 10,665 in urban areas and 19,710 in rural areas. The sample was expected to result in about 30,340 completed interviews with ever-married women age 15–49, 10,532 in urban areas and 19,808 in rural areas.

Table A.2 Sample allocation of clusters by division and type of residence

Division	Number of clusters allocated

Bangladesh	4,090	6,442	10,532	19,808	30,340

The sample allocations were derived using information obtained from the 2017–18 BDHS. The 2017–18 results showed that the average number of ever-married women age 15–49 per household was 1.06 in urban areas and 1.04 in rural areas. The household completion rate was 95.1% in urban areas and 97.4% in rural areas, and women’s individual completion rate was 98.4% in urban areas and 99.0% in rural areas.

Table A.5 presents response rates for ever-married women by urban-rural residence and by division.

A.4 SAMPLE PROBABILITIES AND SAMPLING WEIGHTS

Because of the nonproportional allocation of the sample to different divisions and to their urban and rural areas and the possible differences in response rates, sampling weights are required for any analysis using the 2022 BDHS data to ensure the representativeness of the survey results at the national level and at the domain level. Since the 2022 BDHS sample is a two-stage stratified cluster sample selected from the IMPS master sample, sampling weights are calculated based on sampling probabilities separately for each

sampling stage, including the master sample selection probabilities, and for each cluster. The following notations were used:

P_{0hi} : sampling probability of the i^{th} EA in stratum h in the selection of the IMPS master sample from the 2011 census frame

P_{1hi} : first-stage sampling probability of the i^{th} EA in stratum h from the IMPS master sample

P_{2hi} : second-stage sampling probability of households within the i^{th} EA

The IMPS master sample was selected with a stratified probability proportional to size procedure. Let a_h be the number of EAs selected in stratum h , M_{hi} the measure of size (number of households) according to the 2011 census frame in the i^{th} EA, and $\sum M_{hi}$ the total measure of size (total number of households) in stratum h . The probability of selecting the i^{th} EA in the IMPS master sample is calculated as follows:

$$P_{0hi} = \frac{a_h M_{hi}}{\sum M_{hi}}$$

Let b_h be the number of EAs selected in stratum h of the IMPS master sample for the 2022 BDHS. Then the probability of selecting EA i in the sample is:

$$P_{1hi} = \frac{b_h}{a_h}$$

Let L_{hi} be the number of households listed in the household listing operation in the cluster i in stratum h , and let g_{hi} be the number of households selected in the cluster. The second stage's selection probability for each household in the cluster is calculated as follows:

$$P_{2hi} = \frac{g_{hi}}{L_{hi}}$$

The overall selection probability of each household in cluster i of stratum h in the 2022 BDHS is therefore the product of the selection probabilities:

$$P_{hi} = P_{0hi} \times P_{1hi} \times P_{2hi} = \frac{b_h M_{hi}}{\sum M_{hi}} \times \frac{g_{hi}}{L_{hi}}$$

The design weight for each household in cluster i of stratum h is the inverse of its overall selection probability:

$$W_{hi} = 1 / P_{hi}$$

Next, the design weights were adjusted for household nonresponse and individual nonresponse to obtain the sampling weights for households and for women, respectively. Nonresponse was adjusted at the sampling stratum level. For the household sampling weight, the household design weight was multiplied by the inverse of the household response rate by stratum. For women's individual sampling weight, the household sampling weight was multiplied by the inverse of women's individual response rate by stratum. After adjusting for nonresponse, the sampling weights were normalized to obtain the final standard weights that appear in the data files. The normalization process was done so that the total number of unweighted cases would be equal to the total number of weighted cases at the national level for the total number of

households and women. Normalization was done by multiplying the sampling weight by the estimated sampling fraction obtained from the survey for the household weight and the individual woman's weight. The normalized weights are relative weights that are valid for estimating means, proportions, ratios, and rates but are not valid for estimating population totals or for pooled data.

Table A.5 Sample implementation

Percent distribution of households and eligible women age 15–49 by results of the household and individual interviews, and household, eligible women, and overall women response rates, according to residence and division (unweighted), Bangladesh DHS 2022

Result	Residence			Division						Total

Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Number of women	10,711	19,647	3,256	4,494	4,631	3,956	3,282	3,845	3,656	3,238
Eligible women response rate (EWRR) ²	98.7	99.3	99.3	99.3	98.3	99.3	99.2	99.2	99.1	99.1
Overall women response rate (OWRR) ³	98.1	99.0	98.8	99.1	96.9	99.1	99.0	99.0	98.9	98.6

¹ Using the number of households falling into specific response categories, the household response rate (HRR) is calculated as:

$$\frac{100 * C}{C + HP + P + R + DNF}$$

² The eligible women response rate (EWRR) is equivalent to the percentage of interviews completed (EWC).

³ The overall women response rate (OWRR) is calculated as:

$$OWRR = HRR * EWRR/100$$

The estimates from a sample survey are affected by two types of errors: nonsampling errors and sampling errors. Nonsampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the 2022 Bangladesh Demographic and Health Survey (BDHS) to minimize this type of error, nonsampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in the 2022 BDHS is only one of many samples that could have been selected from the same population, using the same design and expected size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

Sampling error is usually measured in terms of the *standard error* for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95% of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the 2022 BDHS sample is the result of a multistage stratified design, and, consequently, it was necessary to use more complex formulas. Sampling errors are computed in SAS using programs developed by ICF. These programs use the Taylor linearization method to estimate variances for survey estimates that are means, proportions, or ratios. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as fertility and mortality rates.

The Taylor linearization method treats any percentage or average as a ratio estimate, $r = y/x$, where y represents the total sample value for variable y and x represents the total number of cases in the group or subgroup under consideration. The variance of r is computed using the formula given below, with the standard error being the square root of the variance:

$$SE^2(r) = var(r) = \frac{1-f}{x^2} \sum_{h=1}^H \left[\frac{m_h}{m_h - 1} \left(\sum_{i=1}^{m_h} z_{hi}^2 - \frac{z_h^2}{m_h} \right) \right]$$

in which

$$z_{hi} = y_{hi} - rx_{hi} \text{ and } z_h = y_h - rx_h$$

where h represents the stratum, which varies from 1 to H ;
 m_h is the total number of clusters selected in the h^{th} stratum;
 y_{hi} is the sum of the weighted values of variable y in the i^{th} cluster in the h^{th} stratum;
 x_{hi} is the sum of the weighted number of cases in the i^{th} cluster in the h^{th} stratum; and

f is the overall sampling fraction, which is so small that it is ignored.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample and calculates standard errors for these estimates using simple formulas. Each replication considers *all but one* cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the 2022 BDHS, there were 674 non-empty clusters. Hence, 674 replications were created. The variance of a rate r is calculated as follows:

$$SE^2(r) = var(r) = \frac{1}{k(k-1)} \sum_{i=1}^k (r_i - r)^2$$

in which

$$r_i = kr - (k-1)r_{(i)}$$

where r is the estimate computed from the full sample of 674 clusters,
 $r_{(i)}$ is the estimate computed from the reduced sample of 673 clusters (i^{th} cluster excluded),
and
 k is the total number of clusters.

In addition to the standard error, the design effect (DEFT) for each estimate is also calculated. The design effect is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. Relative standard errors and confidence limits for the estimates are also calculated.

Sampling errors for the 2022 BDHS are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for the country as a whole, for urban and rural areas, and for each of the eight divisions. For each variable, the type of statistic (mean, proportion, or rate) and the base population are given in **Table B.1**. **Tables B.2** through **B.12** present the value of the statistic (R), its standard error (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95% confidence limits ($R \pm 2SE$) for each selected variable. The DEFT is considered undefined when the standard error considering a simple random sample is zero (when the estimate is close to 0 or 1).

The confidence interval (e.g., as calculated for *ideal number of children*) can be interpreted as follows: the overall average from the national sample is 2.303 and its standard error is 0.010. Therefore, to obtain the 95% confidence limits, one adds and subtracts twice the standard error to the sample estimate, that is, $2.303 \pm 2 \times 0.010$. There is a high probability (95%) that the true ideal number of children is between 2.282 and 2.324.

For the total sample, the value of the DEFT, averaged over all indicators in the appendix, is about 1.5. This means that, due to multistage clustering of the sample, the average standard error is increased by a factor of 1.5 over that in an equivalent simple random sample.

Table B.1 List of selected variables for sampling errors, Bangladesh DHS 2022

Variable	Estimate	Base population
HOUSEHOLDS AND POPULATION		
Births registered with civil authority	Proportion	De jure household population under 5
Improved drinking water source	Proportion	De jure household population
Improved sanitation facility	Proportion	De jure household population
At least basic sanitation service	Proportion	De jure household population
Using open defecation	Proportion	De jure household population
Using a handwashing facility with soap and water	Proportion	De jure household population for whom handwashing place was observed or with no on-site place for handwashing
WOMEN		
Urban residence	Proportion	Women 15–49
No education	Proportion	Women 15–49
Secondary education or higher	Proportion	Women 15–49
Literacy	Proportion	Women 15–49
Use of the internet in last 12 months	Proportion	Women 15–49
Currently married/in union	Proportion	Women 15–49
Married before age 15	Proportion	Women 20–49
Married before age 18	Proportion	Women 20–49
Had sexual intercourse before age 18	Proportion	Women 20–49
Age-specific fertility rate 15–19	Rate	Woman-years of exposure to childbearing at 15–19 in the 3 years preceding the survey
Total fertility rate (3 years)	Rate	Woman-years of exposure to childbearing
Currently pregnant	Proportion	Women 15–49
Mean number of children ever born to women age 40–49	Mean	Women 40–49
Mean number of children ever born to women age 15–49	Mean	Women 15–49
Mean number of living children among women age 15–49	Mean	Women 15–49
Median birth interval	Median	Non-first births in the 5 years preceding the survey
First birth before age 18	Proportion	Women 20–49
Want to delay next birth at least 2 years	Proportion	Currently married women 15–49
Want no more children	Proportion	Currently married women 15–49
Ideal number of children	Mean	Women 15–49 with numeric responses
Total wanted fertility rate (3 years)	Rate	Woman-years of exposure to childbearing
Currently using any contraceptive method	Proportion	Currently married women 15–49
Currently using any modern method	Proportion	Currently married women 15–49
Currently using pill	Proportion	Currently married women 15–49
Currently using injectables	Proportion	Currently married women 15–49
Currently using implants	Proportion	Currently married women 15–49
Currently using male condom	Proportion	Currently married women 15–49
Currently using any traditional method	Proportion	Currently married women 15–49
12-month discontinuation rate due to method failure	Rate	Women 15–49
12-month discontinuation rate due to any reason	Rate	Women 15–49
12-month discontinuation rate due to switching to another method	Rate	Women 15–49
Unmet need for spacing	Proportion	Currently married women 15–49
Unmet need for limiting	Proportion	Currently married women 15–49
Unmet need total	Proportion	Currently married women 15–49
Demand satisfied by modern methods	Proportion	Currently married women 15–49
Participation in decision making about family planning	Proportion	Currently married women 15–49
Not exposed to any of the eight media sources	Proportion	Women 15–49
Neonatal mortality rate ¹	Rate	Children exposed to the risk of mortality
Postneonatal mortality rate ¹	Rate	Children exposed to the risk of mortality
Infant mortality rate ¹	Rate	Children exposed to the risk of mortality
Child mortality rate ¹	Rate	Children exposed to the risk of mortality
Under-5 mortality rate ¹	Rate	Children exposed to the risk of mortality
Perinatal mortality rate	Rate	Pregnancies of 7 or more months' duration among women 15–49 in the 3 years preceding the survey
Stillbirth rate	Rate	Pregnancies of 7 or more months' duration to women 15–49 in the 3 years preceding the survey
Early neonatal mortality rate	Rate	Pregnancies of 7 or more months' duration to women 15–49 in the 3 years preceding the survey
In any avoidable high-risk category	Proportion	Children born in the 3 years preceding the survey to women 15–49 in the 3 years preceding the survey
Received ANC from a skilled provider	Proportion	Women 15–49 who had a live birth in the 2 years preceding the survey
4+ ANC visits	Proportion	Women 15–49 who had a live birth in the 2 years preceding the survey
8+ ANC visits	Proportion	Women 15–49 who had a live birth in the 2 years preceding the survey
Mothers protected against tetanus for last birth	Proportion	Women 15–49 with a live birth in the 2 years preceding the survey
Delivered in a health facility (live births)	Proportion	Live births in the 2 years preceding the survey
Delivered by a skilled provider (live births)	Proportion	Live births in the 2 years preceding the survey
Delivered by C-section (live births)	Proportion	Live births in the 2 years preceding the survey
Women with postnatal check during first 2 days	Proportion	Women 15–49 with a live birth in the 2 years preceding the survey
Newborns with postnatal check during first 2 days	Proportion	Most recent live births in the 2 years preceding the survey
Any problem accessing health care	Proportion	Women 15–49
Sought treatment for diarrhea	Proportion	Children under 5 with diarrhea in last 2 weeks
Treated with ORS	Proportion	Children under 5 with diarrhea in last 2 weeks
Height-for-age (-3 SD)	Proportion	Children under 5 who were measured
Height-for-age (-2 SD)	Proportion	Children under 5 who were measured
Weight-for-height (-2 SD)	Proportion	Children under 5 who were measured
Weight-for-height (+2 SD)	Proportion	Children under 5 who were measured
Weight-for-age (-2 SD)	Proportion	Children under 5 who were measured
Exclusive breastfeeding	Proportion	Youngest children 0–5 months living with their mother

Continued...

Table B.1—Continued

Variable	Estimate	Base population
Minimum dietary diversity (children 6–23 months)	Proportion	Youngest children 6–23 months living with their mother
Body mass index (BMI) <18.5	Proportion	Women 20–49 who were measured
Body mass index (BMI) ≥25	Proportion	Women 20–49 who were measured
Body mass index-for-age (-2 SD)	Proportion	Adolescent women 15–19 who were measured
Body mass index-for-age (+1 SD)	Proportion	Adolescent women 15–19 who were measured
Prevalence of hypertension (women 18+)	Proportion	Women 18+
Prevalence of diabetes (women 18+)	Proportion	Women 18+
Employed in last 12 months	Proportion	Currently married women 15–49
Employed in last 12 months, but not paid	Proportion	Currently married women 15–49 employed in last 12 months
Mobile phone ownership	Proportion	Women 15–49
Have and use a bank account or mobile phone for financial transactions	Proportion	Women 15–49
Participate in decision making (all three decisions)	Proportion	Currently married women 15–49
Agree with at least one specified reason a husband is justified in wife beating	Proportion	Women 15–49

¹ The mortality rates are calculated for 3 years before the survey for the national sample, for 5 years before the survey for urban, rural and divisional samples.

¹Ten children were measured twice for each standardization and restandardization exercise.

²Trainees' precision and accuracy are defined in terms of a technical error of measurement (TEM), which is calculated as $\sqrt{\sum(D^2)/(2N)}$, where D is the difference in height and N is the number of repeat measurements. An acceptable TEM according to WHO-UNICEF is a TEM of <0.6 cm for precision and <0.8 cm for accuracy.

Table C.8 Height and weight data completeness and quality for children

Among children under age 5 (age 0–59 months) who were eligible for anthropometry, percentage with incomplete or missing data for height, weight, or month or year of birth; among children with complete data on height and age, percentage with implausible data for height-for-age; among children with complete data on weight and height, percentage with implausible data for weight-for-height; among children with complete data on weight and age, percentage with implausible data for weight-for-age; and among all children under age 5 who were eligible for anthropometry, percentage with valid data for height-for-age, weight-for-height, or weight-for-age, according to background characteristics (unweighted), Bangladesh DHS 2022

Background characteristic	Percentage with data incomplete or missing for:				Percentage with implausible data for:				Percentage with valid data for ⁸ :

¹ Child's height in centimeters is missing, child was not present, child refused, and other result codes

² Child's weight in kilograms is missing, child was not present, child refused, and other result codes

³ Incomplete date of birth; a complete date of birth is month/day/year or month/year.

⁴ Implausible cases for height-for-age are defined as more than 6 standard deviations (SD) above or below the standard population median (z scores) based on the WHO Child Growth Standards among children with complete height and month/year of birth data.

⁵ Complete age is calculated from month and year of birth.

⁶ Implausible cases for weight-for-height are defined as more than 5 SD above or below the standard population median (z scores) based on the WHO Child Growth Standards among children with complete weight and height data.

⁷ Implausible cases for weight-for-age are defined as more than 5 SD above or 6 SD below the standard population median (z scores) based on the WHO Child Growth Standards among children with complete weight and month/year of birth data.

⁸ No missing data, incomplete data, or implausible data

Table C.9 Height measurements from random subsample of measured children

Differences in first height measurement and second height measurement among children under age 5 (0–59 months) randomly selected and remeasured, according to division and measurer (unweighted), Bangladesh DHS 2022

Division and measurer	Median difference in height measurements ¹	Percentage of height measurements with a difference >1 cm	Number of children randomly selected and remeasured

**Table C.12 Heaping in anthropometric measurements for children
(digit preference)**

Distribution of weight and height/length measurements by decimal digit recorded (unweighted), Bangladesh DHS 2022

Digit	Weight		Height or length	
	Number	Percent	Number	Percent
0	417	9.3	282	6.4
1	466	10.4	495	11.2
2	459	10.3	565	12.8
3	442	9.9	513	11.6
4	431	9.6	471	10.6
5	501	11.2	490	11.1
6	431	9.6	488	11.0
7	450	10.1	401	9.1
8	414	9.3	380	8.6
9	458	10.2	339	7.7
Total	4,469	100.0	4,424	100.0
Index of dissimilarity ¹	na	2.2	na	8.3

Note: Table includes all children with weight and height/length measurements, regardless of the completeness of date of birth information and cases with implausible data. Both weight and length/height measurements are recorded with one decimal digit.

na = not applicable

¹ The index of dissimilarity is a measure of digit preference calculated as one-half of the sum of absolute differences between the observed and expected percentage. It can be interpreted as the percentage of values that would need to be redistributed in order to achieve a uniform distribution.

Table C.13 Observation of handwashing facility

Percent distribution of handwashing facilities in all households by whether or not they were observed by the interviewers, according to background characteristics (weighted), Bangladesh DHS 2022

24 ^a	83.0	0.0	0.1	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.1	16.6	0.2	100.0	531

Note: Age at the beginning of the school year is calculated from dates of birth of household members or by rejuvenating household members based on the date of the survey, the date after the start of the school year, and completed age at the time of the survey. Levels and grades refer to the current school year or the most recent school year if data collection was completed between school years.

^a Those age 25 at the time of the interview who were age 24 at the beginning of the school year are excluded from the table since data on current attendance were collected only for those age 4–24 at the time of the interview.

PERSONS INVOLVED IN THE 2022 BDHS

নিপোট কর্তৃক ‘ডেমোগ্রাফিক অ্যান্ড হেলথ সার্ভে (বিডিএইচএস) ২০২২’ পরিচালনার মাধ্যমে পরিসংখ্যান প্রস্তুত ও প্রকাশের জন্য বাংলাদেশ পরিসংখ্যান বুরোর অনাপত্তি

পরিসংখ্যান আইন, ২০১৩ (২০১৩ সনের ১২ নং আইন) এর ধারা ১১ এর উদ্দেশ্য পূরণকল্পে উক্ত আইন এবং এতৎক্রান্ত বিধি ও নীতিমালা অনুযায়ী নিম্নবর্ণিত শর্তসাপক্ষে জাতীয় জনসংখ্যা গবেষণা ও প্রশিক্ষণ ইন্সটিউট (নিপোট)-কে ‘বাংলাদেশ ডেমোগ্রাফিক অ্যান্ড হেলথ সার্ভে ২০২২’ শীর্ষক জরিপ পরিচালনা ও প্রতিবেদন প্রকাশের অনাপত্তি প্রদান করা হলো:

শর্তসমূহ:

- (ক) জরিপের ক্ষেত্র: স্বাস্থ্য ও জনতত্ত্ব
- (খ) (অ) নমুনায়ন ফ্রেম: Integrated Census Management System (ICMS) for Population and Housing Census 2022.
 (আ) নমুনায়ন পদ্ধতি: সম্ভাবনা নির্ভর নমুনায়ন।
 (ই) নমুনা আয়তন নিরূপণ পদ্ধতি: ফর্মুলা নির্ভর।
 (ঈ) নমুনা আয়তন/নমুনা এককের সংখ্যা: নমুনায়ন সংক্রান্ত উপকরণটির সুপারিশ অনুযায়ী নির্ধারণযোগ্য।
 (উ) তথ্য সংগ্রহের সময়কাল: মার্চ হতে জুলাই ২০২২।
 (ঊ) ফলাফল প্রকাশের সময়কাল:
 (i) প্রাথমিক ফলাফল প্রকাশ: নভেম্বর ২০২২ (প্রকাশের পূর্বে অনাপত্তি প্রদান পর্যালোচনা কমিটিতে উপস্থাপন করতে হবে)।
 (ii) চূড়ান্ত প্রতিবেদন প্রকাশ: মার্চ ২০২৩ (প্রকাশের পূর্বে অনাপত্তি প্রদান পর্যালোচনা কমিটিতে উপস্থাপন করতে হবে)।
 (ঋ) প্রকাশনা/প্রতিবেদনের Reliability of Estimates: প্রকাশিত প্রতিবেদনে Reliability of Estimates নির্ণয়পূর্বক সংযোজন করতে হবে।
- (গ) ‘বাংলাদেশ ডেমোগ্রাফিক অ্যান্ড হেলথ সার্ভে (বিডিএইচএস) ২০২২’ সার্ভে পরিচালনা ও প্রকাশের ক্ষেত্রে বিবিএস কর্তৃক প্রস্তুতকৃত ও প্রকাশিত উপাত্তের সাথে দ্বৈততা রয়েছে এমন সূচকসমূহের ক্ষেত্রে Key Findings Table এবং প্রতিবেদনের সংশ্লিষ্ট সকল সারণির নিচে ফুটনোট আকারে Disclaimer হিসেবে ‘Not to be treated as official statistics as BBS regularly produces such estimates’ উল্লেখ করতে হবে;
- (ঘ) নিপোট কর্তৃক পরিচালিত ‘বাংলাদেশ ডেমোগ্রাফিক অ্যান্ড হেলথ সার্ভে (বিডিএইচএস) ২০২২’-এর রিপোর্টে প্রকাশিত উপাত্ত শুধুমাত্র হেলথ প্রোগ্রাম মনিটরিং কাজে ব্যবহার করা হবে। জাতীয় ও আন্তর্জাতিক এজেন্ডা পরিবীক্ষণ ও অগ্রগতি প্রতিবেদন (যেমন: ৮ম পঞ্চবর্ষিক পরিকল্পনা, টেকসই উন্নয়ন লক্ষ্যমাত্রা (এসডিজি), প্রেক্ষিত পরিকল্পনা ইত্যাদি)’র ক্ষেত্রে অবশ্যই বিবিএস কর্তৃক প্রণীত সরকারি পরিসংখ্যানকে অগ্রাধিকার দিতে হবে;
- (ঙ) বিভিন্ন সূচকের বিপরীতে উপাত্তের ভিন্নতা দূর করতে নিপোট এবং বিবিএস-এর জনতাত্ত্বিক জরিপগুলোর মধ্যে সময় ও পদ্ধতিগত বিষয়ে Harmonize করতে হবে;
- (চ) এসডিজি সূচক ২.২.৩ (১৫-৪৯ বছর বয়সী গর্ভবতী মহিলাদের মধ্যে রক্ত স্বল্পতার ব্যাপকতা)-এর প্রাক্কলন অন্তর্ভুক্তির লক্ষ্যে ‘বাংলাদেশ ডেমোগ্রাফিক অ্যান্ড হেলথ সার্ভে (বিডিএইচএস) ২০২২’-এ প্রয়োজনীয় প্রশ্ন সংযোজনসহ ব্যবস্থা গ্রহণ করতে হবে;
- (ছ) তথ্য সংগ্রহের পূর্বে তথ্য সংগ্রহকারীদের যথাযথ প্রশিক্ষণ প্রদান নিশ্চিত করতে হবে এবং প্রশিক্ষণসহ মাঠ পর্যায়ে তথ্য সংগ্রহ কার্যক্রম পরিবীক্ষণে ‘জরিপ/শুমারি প্রস্তাব পরীক্ষা, অনুমোদন ও পরিবীক্ষণ কমিটি’কে সক্রিয়ভাবে সম্পৃক্ত করতে হবে;
- (জ) প্রকাশিত জরিপ প্রতিবেদনের সাথে বিবিএস-এর অনাপত্তিগত সংযুক্ত করতে হবে এবং বিবিএসকে প্রাথমিক ও চূড়ান্ত উভয় প্রকাশনার ১০ (দশ) টি হার্ডকপি সরবরাহ করতে হবে;
- (ঝ) ‘সংস্থা কর্তৃক পরিসংখ্যান প্রস্তুত ও প্রকাশ নীতিমালা, ২০১৬’-এর অনুচ্ছেদ-৪, ৫ ও ৭ এর নির্দেশনাসমূহ যথাযথভাবে প্রতিপালন করতে হবে;
- (ঝঃ) জরিপের প্রাথমিক ও চূড়ান্ত উভয় প্রতিবেদন প্রকাশের পূর্বে প্রস্তুতকৃত খসড়া প্রতিবেদন পূর্ব-পর্যালোচনার জন্য বিবিএস-এর ‘জরিপ/শুমারি, পরীক্ষা, অনুমোদন ও পরিবীক্ষণ কমিটি’র সভায় উপস্থাপন করতে হবে।

/অপর পৃষ্ঠা দ্রষ্টব্য/

- ২। নিপোট 'সংস্থা কর্তৃক পরিসংখ্যান প্রস্তুত ও প্রকাশ নীতিমালা, ২০১৬'-এর অনুসরণ এবং বুরো কর্তৃক প্রদত্ত শর্তাবলী পূরণ ও মান বজায় রাখার বিষয়টি নিশ্চিত করবে।
- ৩। নির্ধারিত সময়সীমার মধ্যে পরিসংখ্যান প্রস্তুত ও প্রকাশের কার্যক্রম সম্পন্ন করতে না পারলে, নিপোট এ বিধিমালার অধীন বাংলাদেশ পরিসংখ্যান বুরোর নিকট সময় বৃদ্ধির আবেদন করতে পারবে।
- ৪। 'সংস্থা কর্তৃক পরিসংখ্যান প্রস্তুত ও প্রকাশ নীতিমালা, ২০১৬' যথাযথভাবে অনুসরণ এবং শর্তসমূহ যথাযথভাবে পূরণ ও মান বজায় রাখার বিষয়টি বাংলাদেশ পরিসংখ্যান বুরো এবং নিপোটের যৌথ পরিবীক্ষণের (Monitoring) মাধ্যমে নিশ্চিত করতে হবে।

INTRODUCTION AND CONSENT

Hello. My name is I am working with Mitra and Associates, a private research organization located in Dhaka. We are conducting a survey about health and other topics all over Bangladesh under the authority of the National Institute of Population Research and Training (NIPORT), Medical Education and Family Welfare Division, Ministry of Health and Family Welfare (MOHFW). The information we collect will help the government to plan health services. Your household was selected for the survey. I would like to ask you some questions about your household. The questions usually take about 15 to 20 minutes. All of the answers you give will be confidential and will not be shared with anyone other than members of our survey team. You don't have to be in the survey, but we hope you will agree to answer the questions since your views are important. If I ask you any question you don't want to answer, just let me know and I will go on to the next question or you can stop the interview at any time.

In case you need more information about the survey, you may contact BMRC or Mitra and Associates, and NIPORT in Dhaka.

INTRODUCTION AND CONSENT

(1)

Hello. My name is _____ . I am working with Mitra and Associates, a private research organization located in Dhaka. We are conducting a survey about health and other topics all over Bangladesh under the authority of the National Institute of Population Research and Training (NIPORT), Medical Education and Family Welfare Division, Ministry of Health and Family Welfare (MOHFW). We are conducting a survey about health and other topics all over Bangladesh. The information we collect will help the government to plan health services. Your household was selected for the survey. The questions usually take about 30 to 60 minutes. All of the answers you give will be confidential and will not be shared with anyone other than members of our survey team. You don't have to be in the survey, but we hope you will agree to answer the questions since your views are important. If I ask you any question you don't want to answer, just let me know and I will go on to the next question or you can stop the interview at any time.

In case you need more information about the survey, you may contact the person listed on the card that has already been given to your household.

MTH9	Thank you for answering this series of questions. Based on the information you shared with me about your recent experiences, you may benefit from services provided by [NAME OF AGENCY]. PROVIDE RESPONDENT WITH REFERRAL CARD. This card provides [NAME OF AGENCY]'s contact information.		
1116	RECORD THE TIME.	HOURS MINUTES <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>	

(1) In some settings, there may be an ethical requirement to provide a referral to mental health or counselling services when a respondent reports thoughts about self harm. In these settings, the survey team should investigate whether or not these services are available to refer respondents to. If a referral is recommended, but the services are not available, the country may need to consider removing PHQ9 from the Mental Health module.

(2) Coding categories to be adapted locally

(3) If question PHQ9 is excluded, the scoring procedure and cutoffs remain the same. The only change will be that the maximum score possible on the PHQ scale will be 24 instead of 27. If PHQ9 is excluded, adjust referral instructions in MTH8 to remove reference to

(4) Adapt referral instructions to country context.

Z DON'T KNOW

(1) Year of fieldwork is assumed to be 2022. For fieldwork beginning in 2023, all references to calendar years should be increased by one; for example, 2017 should be changed to 2018, 2018 should be changed to 2019, and similarly for all years throughout the questionnaire.

(2) Response categories may be added for other methods, including fertility awareness methods.

ADULT RESPONDENT CONSENT FOR BLOOD PRESSURE MEASUREMENT			
A D U L T R E S P O N D E N T C O N S E N T	214	I would like to measure your blood pressure. This will be done three times, with an interval of about five minutes between measurements. This is a harmless procedure. Blood pressure measurement is used to find out if a person has high blood pressure. If not treated, high blood pressure may eventually cause serious damage to the heart. The results of this blood pressure measurement will be given to you after the measurement process is completed. The results of blood pressure measurement will be explained to you. If your blood pressure is high, we will suggest that you consult a health facility or doctor since we cannot provide any further testing or treatment during the survey. You can also decide at any time not to participate in the blood pressure measurement. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team. Do you have any questions? You can say yes to the test or you can say no. It is up to you to decide. Will you allow me to measure your blood pressure?	
	# 215	CIRCLE THE CODE.	GRANTED 1 REFUSED 2 → 232 NOT PRESENT/OTHER 3 → 268
	216	SIGN NAME AND ENTER BIOMARKER TECHNICIAN NUMBER OF BLOOD PRESSURE MEASURER.	(SIGN) BIOMARKER TECHNICIAN
	217	Before measuring I would like to ask a few questions about things that may affect blood pressure. Have you done any of the following within the past 30 minutes: a) Eaten anything? b) Had coffee, tea, cola or other drink that has caffeine? c) Smoked any tobacco product? d) Conducted any physical activity or exercises that made you breathe harder than usual?	YE NO DK a EATEN 1 2 8 b CAFFEINE 1 2 8 c SMOKED 1 2 8 d EXERCISED 1 2 8
	218	May I begin the process of measuring your blood pressure? I will begin by measuring the circumference of your arm to make sure that I use the right equipment. BEFORE TAKING THE FIRST BLOOD PRESSURE READING, MEASURE THE CIRCUMFERENCE OF THE RESPONDENT'S ARM MIDWAY BETWEEN THE ELBOW AND THE SHOULDER. RECORD THE MEASUREMENT IN CENTIMETERS.	ARM CIRCUMFERENCE (IN CENTIMETERS) ...

256	<p>ASK CONSENT FOR FASTING BLOOD SUGAR TESTING</p> <p>As part of this survey, we are asking people all over the country to take a blood glucose test. Your glucose level may be an indicator that can measure your risk associated with some non-communicable diseases such as diabetes. This survey will assist the government to develop programs to prevent and treat high and low glucose levels.</p> <p>For the blood glucose testing, we will need a few drops of blood from a finger. The equipment used to take the blood is clean and completely safe. It has never been used before and will be thrown away after each test. The blood will be tested for glucose immediately, and the result will be told to you right away for further follow up, if necessary. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team. The results will be given to you with an explanation of the meaning of your blood glucose numbers.</p> <p>If your blood glucose is high, we will suggest that you consult a health facility or doctor since we cannot provide any counselling, further testing or treatment during the survey.</p> <p>Do you have any questions? If you have any questions about the procedure at any time, please ask me. For more information, you may also contact the person(s) on the card that was given out at the beginning.</p> <p>To obtain correct blood glucose measurement, we would ask that you do not eat or drink anything except plain water for at least 8 hours prior to my blood glucose testing visit.</p>

BLOOD PRESSURE AND BLOOD GLUCOSE MEASUREMENT FOR WOMEN AGE 18+

	WOMAN 2	SKIP
--	---------	------

ADULT RESPONDENT CONSENT FOR BLOOD PRESSURE MEASUREMENT							
A D U L T R E S P O N D E N T C O N S E N T	214	<p>I would like to measure your blood pressure. This will be done three times, with an interval of about five minutes between measurements. This is a harmless procedure. Blood pressure measurement is used to find out if a person has high blood pressure. If not treated, high blood pressure may eventually cause serious damage to the heart. The results of this blood pressure measurement will be given to you after the measurement process is completed. The results of blood pressure measurement will be explained to you. If your blood pressure is high, we will suggest that you consult a health facility or doctor since we cannot provide any further testing or treatment during the survey. You can also decide at any time not to participate in the blood pressure measurement. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team.</p> <p>Do you have any questions? You can say yes to the test or you can say no. It is up to you to decide. Will you allow me to measure your blood pressure?</p>

254

CIRCLE THE VALUE FROM 253 IN THE TABLE BELOW. CIRCLE THE SAME VALUE IN THE BLOOD PRESSURE REPORTING FORM. READ ALOUD TO THE RESPONDENT THE REPORTING FORM INSTRUCTIONS TO THE RIGHT OF THAT NUMBER, THEN GIVE THE FORM TO THE RESPONDENT AND ANSWER ANY QUESTIONS THE RESPONDENT MAY HAVE.

VALUE FROM BP253:	RESPONDENT'S BLOOD PRESSURE CATEGORY:	CONSULT HEALTH PROVIDER TO CHECK BLOOD PRESSURE WITHIN:
1	ACCEPTABLE RANGE	24 MONTHS
2	AT THE HIGH END OF THE ACCEPTABLE RANGE	12 MONTHS
3	ABOVE ACCEPTABLE RANGE	2 MONTHS
4	MODERATELY HIGH	1 MONTH
5	HIGH	7 DAYS
6	VERY HIGH	TODAY

255

CHECK IF THE RESPONDENT RECEIVED THE BLOOD PRESSURE REPORTING FORM WITH WRITTEN RESULTS

REPORTING FORM RECEIVED 1
NOT RECEIVED 2

256

ASK CONSENT FOR FASTING BLOOD SUGAR TESTING

As part of this survey, we are asking people all over the country to take a blood glucose test. Your glucose level may be an indicator that can measure your risk associated with some non-communicable diseases such as diabetes. This survey will assist the government to develop programs to prevent and treat high and low glucose levels.

For the blood glucose testing, we will need a few drops of blood from a finger. The equipment used to take the blood is clean and completely safe. It has never been used before and will be thrown away after each test. The blood will be tested for glucose immediately, and the result will be told to you right away for further follow up, if necessary. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team. The results will be given to you with an explanation of the meaning of your blood glucose numbers.

If your blood glucose is high, we will suggest that you consult a health facility or doctor since we cannot provide any counselling, further testing or treatment during the survey.

Do you have any questions? If you have any questions about the procedure at any time, please ask me. For more information, you may also contact the person(s) on the card that was given out at the beginning.

To obtain correct blood glucose measurement, we would ask that you do not eat or drink anything except plain water for at least 8 hours prior to my blood glucose testing visit.

ADULT RESPONDENT CONSENT FOR BLOOD PRESSURE MEASUREMENT							
A D U L T R E S P O N D E R C O N S E N T	314	I would like to measure your blood pressure. This will be done three times, with an interval of about five minutes between measurements. This is a harmless procedure. Blood pressure measurement is used to find out if a person has high blood pressure. If not treated, high blood pressure may eventually cause serious damage to the heart. The results of this blood pressure measurement will be given to you after the measurement process is completed. The results of blood pressure measurement will be explained to you. If your blood pressure is high, we will suggest that you consult a health facility or doctor since we cannot provide any further testing or treatment during the survey. You can also decide at any time not to participate in the blood pressure measurement. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team. Do you have any questions? You can say yes to the test or you can say no. It is up to you to decide. Will you allow me to measure your blood pressure?					
	# 315	CIRCLE THE CODE.	GRANTED 1 REFUSED 2 NOT PRESENT/OTHER 3 → 332 → 368				
	316	SIGN NAME AND ENTER BIOMARKER TECHNICIAN NUMBER OF BLOOD PRESSURE MEASURER.	(SIGN) <table border="1" style="margin-left: auto; margin-right: auto;"><tr><td> </td><td> </td><td> </td></tr></table> BIOMARKER TECHNICIAN				
	317	Before measuring I would like to ask a few questions about things that may affect blood pressure. Have you done any of the following within the past 30 minutes: a) Eaten anything? b) Had coffee, tea, cola or other drink that has caffeine? c) Smoked any tobacco product? d) Conducted any physical activity or exercises that made you breathe harder than usual?	YE NO DK a EATEN 1 2 8 b CAFFEINE 1 2 8 c SMOKED 1 2 8 d EXERCISED 1 2 8				
	318	May I begin the process of measuring your blood pressure? I will begin by measuring the circumference of your arm to make sure that I use the right equipment. BEFORE TAKING THE FIRST BLOOD PRESSURE READING, MEASURE THE CIRCUMFERENCE OF THE RESPONDENT'S ARM MIDWAY BETWEEN THE ELBOW AND THE SHOULDER. RECORD THE MEASUREMENT IN CENTIMETERS.	ARM CIRCUMFERENCE (IN CENTIMETERS) ... <table border="1" style="margin-left: auto; margin-right: auto;"><tr><td> </td><td> </td></tr></table>

356	<p>ASK CONSENT FOR FASTING BLOOD SUGAR TESTING</p> <p>As part of this survey, we are asking people all over the country to take a blood glucose test. Your glucose level may be an indicator that can measure your risk associated with some non-communicable diseases such as diabetes. This survey will assist the government to develop programs to prevent and treat high and low glucose levels.</p> <p>For the blood glucose testing, we will need a few drops of blood from a finger. The equipment used to take the blood is clean and completely safe. It has never been used before and will be thrown away after each test. The blood will be tested for glucose immediately, and the result will be told to you right away for further follow up, if necessary. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team. The results will be given to you with an explanation of the meaning of your blood glucose numbers.</p> <p>If your blood glucose is high, we will suggest that you consult a health facility or doctor since we cannot provide any counselling, further testing or treatment during the survey.</p> <p>Do you have any questions? If you have any questions about the procedure at any time, please ask me. For more information, you may also contact the person(s) on the card that was given out at the beginning.</p> <p>To obtain correct blood glucose measurement, we would ask that you do not eat or drink anything except plain water for at least 8 hours prior to my blood glucose testing visit.</p> <p>Would you allow me to return to take your blood glucose measurement before you break your fast?</p>

ADULT RESPONDENT CONSENT FOR BLOOD PRESSURE MEASUREMENT					
A D U L T R E S P O N D E R C O N S E N T	314	<p>I would like to measure your blood pressure. This will be done three times, with an interval of about five minutes between measurements. This is a harmless procedure. Blood pressure measurement is used to find out if a person has high blood pressure. If not treated, high blood pressure may eventually cause serious damage to the heart. The results of this blood pressure measurement will be given to you after the measurement process is completed. The results of blood pressure measurement will be explained to you. If your blood pressure is high, we will suggest that you consult a health facility or doctor since we cannot provide any further testing or treatment during the survey. You can also decide at any time not to participate in the blood pressure measurement. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team.</p> <p>Do you have any questions? You can say yes to the test or you can say no. It is up to you to decide. Will you allow me to measure your blood pressure?</p>

- 353 USE THE TABLE TO DETERMINE THE CORRECT VALUE TO RECORD ON THE BLOOD PRESSURE REPORT AND REFERRAL FORM:
 CIRCLE THE ROW WHICH INCLUDES THE VALUE OF THE SYSTOLIC BLOOD PRESSURE
 RECORDED IN 349 OR 352.
 THEN CIRCLE THE COLUMN WHICH INCLUDES THE VALUE OF THE DIASTOLIC BLOOD PRESSURE
 RECORDED IN 349 OR 352.
 THE VALUE IN THE CELL WHERE THE ROW AND THE COLUMN MEET WILL BE USED IN COMPLETING 354.

AVERAGE SYSTOLIC PRESSURE	AVERAGE DIASTOLIC PRESSURE					
	≤ 84	85 - 89	90 - 99	100 - 109	110 - 119	≥ 120
≤ 129	1	2	3	4	5	6
130 - 139	2	2	3	4	5	6
140 - 159	3	3	3	4	5	6
160 - 179	4	4	4	4	5	6
180 - 209	5	5	5	5	5	6
≥ 210	6	6	6	6	6	6

- 354 CIRCLE THE VALUE FROM 353 IN THE TABLE BELOW. CIRCLE THE SAME VALUE IN THE BLOOD PRESSURE REPORTING FORM. READ ALOUD TO THE RESPONDENT THE REPORTING FORM INSTRUCTIONS TO THE RIGHT OF THAT NUMBER, THEN GIVE THE FORM TO THE RESPONDENT AND ANSWER ANY QUESTIONS THE RESPONDENT MAY HAVE.

VALUE FROM 353:	RESPONDENT'S BLOOD PRESSURE CATEGORY:	CONSULT HEALTH PROVIDER TO CHECK BLOOD PRESSURE WITHIN:
1	ACCEPTABLE RANGE	24 MONTHS
2	AT THE HIGH END OF THE ACCEPTABLE RANGE	12 MONTHS
3	ABOVE ACCEPTABLE RANGE	2 MONTHS
4	MODERATELY HIGH	1 MONTH
5	HIGH	7 DAYS
6	VERY HIGH	TODAY

- 355 CHECK IF THE RESPONDENT RECEIVED THE BLOOD PRESSURE REPORTING FORM WITH WRITTEN RESULTS REPORTING FORM RECEIVED 1
 NOT RECEIVED 2

ASK CONSENT FOR FASTING BLOOD SUGAR TESTING

356 As part of this survey, we are asking people all over the country to take a blood glucose test. Your glucose level may be an indicator that can measure your risk associated with some non-communicable diseases such as diabetes. This survey will assist the government to develop programs to prevent and treat high and low glucose levels.

For the blood glucose testing, we will need a few drops of blood from a finger. The equipment used to take the blood is clean and completely safe. It has never been used before and will be thrown away after each test. The blood will be tested for glucose immediately, and the result will be told to you right away for further follow up, if necessary. The result will be kept strictly confidential and will not be shared with anyone other than members of our survey team. The results will be given to you with an explanation of the meaning of your blood glucose numbers.

If your blood glucose is high, we will suggest that you consult a health facility or doctor since we cannot provide any counselling, further testing or treatment during the survey.

Do you have any questions? If you have any questions about the procedure at any time, please ask me. For more information, you may also contact the person(s) on the card that was given out at the beginning.

To obtain correct blood glucose measurement, we would ask that you do not eat or drink anything except plain water for at least 8 hours prior to my blood glucose testing visit.

Would you allow me to return to take your blood glucose measurement before you break your fast?

<p>357 CIRCLE THE APPROPRIATE CODE AND SIGN YOUR NAME</p> <p>(IF 'NOT PRESENT' IN THE 1ST APPOINTMENT, MAKE A 2ND APPOINTMENT, MAKE A 3RD APPOINTMENT)</p>	<p>A) 1ST APPOINTMENT FOR GLUCOSE</p> <p>GRANTED 1 REFUSED 2 SIGN AND GO TO 367 ←</p> <p>SIGN _____ ←</p> <p>RESPONDENT NOT PRESENT 3 (MAKE SECOND APPOINTMENT)</p> <p>B) 2ND APPOINTMENT FOR GLUCOSE</p> <p>GRANTED 1 REFUSED 2 SIGN AND GO TO 367 ←</p> <p>SIGN _____ ←</p> <p>RESPONDENT NOT PRESENT 3 (MAKE THIRD APPOINTMENT) NO NEED FOR FURTHER APPOINTMENT 7</p> <p>C) 3RD APPOINTMENT FOR GLUCOSE</p> <p>GRANTED 1 REFUSED 2 SIGN AND GO TO 367 ←</p> <p>SIGN _____ ←</p> <p>RESPONDENT NOT PRESENT 3 IF ANOTHER MAN GO TO 302 ON NEXT PAGE. INTRODUCTION AND CONSENT

Introductory statement:

My name is _____ . I am working for Mitra and Associates, a private research organization located in Dhaka. We are conducting a survey about health all over Bangladesh under the authority of the National Institute of Population Research and Training (NIPORT), Medical Education and Family Welfare Division, Ministry of Health and Family Welfare (MOHFW). The information we collect will help the government to plan health services. Your household was selected for the survey. I would like to ask you some questions about your household. The questions usually take about 30 minutes. All of the answers you give will be confidential and will not be shared with anyone other than members of our survey team. You don't have to be in the survey, but we hope you will agree to answer the questions since your views are important. If I ask you any question you don't want to answer, just let me know and I will go on to the next question or you can stop the interview at any time.

Why the study being done?

The survey aims to provide information to address the monitoring and evaluation needs of the Fourth Health, Population and Nutrition Sector Program (HPNSP) and to provide managers and policy makers involved in this program with the information that they need to effectively plan and execute future interventions.

What is involved in the study?

You have been selected as respondents in this survey. I would like to ask you some questions about your household and household members.

What will you have to do if you agree to participate?

Since, you have been selected as respondents in this study. I shall be thankful if you provide your valuable response on certain issues. If some questions cause you embarrassment or make you feel uncomfortable, you can refuse to answer them. The survey usually takes about 30 minutes to complete.

What are the risks and benefits of this study?

By providing information you will not have any risk what so ever, rather this will help the government and policy planners to evaluate, strengthen and refocus national effort to improve health, population and nutrition programs.

Confidentiality:

Whatever information you provide will be kept strictly confidential. It will be used for research purposes and will be seen only by staff and researchers at the organizations mentioned.

Is there any compensation for participating in the study?

Your participation in the study is voluntary and promises no financial benefit.

Right to refuse or withdraw:

Participation in this survey is voluntary and you can choose not to answer any individual question or all of the questions. However, we hope that you will participate in this survey since your views are important.

Who do I contact if I have a question or problem?

If you wish to know more about your rights as a participant in this study you may write the Bangladesh Medical Research Council (BMRC), Mohakhali, Dhaka or Mitra and Associates, Main Road 1, House 35, Senpara Parbata, Mirpur 10, Dhaka or Phone 9025410, 9025412. If you have further questions regarding the nature of this study you may also contact NIPORT, 13/1 Sheikh Shaheb Bazar, Azimpur, Dhaka-1205 or Phone 9662495, 58611206.

At this time, do you want to ask me anything about the survey? May I begin the interview now?

INTRODUCTION AND CONSENT

Introductory statement:

Introductory statement:
My name is _____ . I am working for Mitra and Associates, a private research organization located in Dhaka. We are conducting a survey about health all over Bangladesh under the authority of the National Institute of Population Research and Training (NIPORT), Medical Education and Family Welfare Division, Ministry of Health and Family Welfare (MOHFW). The information we collect will help the government to plan health services. Your household was selected for the survey. I would like to ask you some questions about your household. The questions usually take about 30 minutes. All of the answers you give will be confidential and will not be shared with anyone other than members of our survey team. You don't have to be in the survey, but we hope you will agree to answer the questions since your views are important. If I ask you any question you don't want to answer, just let me know and I will go on to the next question or you can stop the interview at any time.

Why the study being done?

The survey aims to provide information to address the monitoring and evaluation needs of the Fourth Health, Population and Nutrition Sector Program (HPNSP) and to provide managers and policy makers involved in this program with the information that they need to effectively plan and execute future interventions.

What is involved in the study?

You have been selected as respondents in this survey. I would like to ask you some questions about your household and household members.

What will you have to do if you agree to participate?

What will you have to do if you agree to participate?
Since, you have been selected as respondents in this study. I shall be thankful if you provide your valuable response on certain issues. If some questions cause you embarrassment or make you feel uncomfortable, you can refuse to answer them. The survey usually takes about 30 minutes to complete.

What are the risks and benefits of this study?

By providing information you will not have any risk what so ever, rather this will help the government and policy planners to evaluate, strengthen and refocus national effort to improve health, population and nutrition programs.

Confidentiality:

Whatever information you provide will be kept strictly confidential. It will be used for research purposes and will be seen only by staff and researchers at the organizations mentioned.

Is there any compensation for participating in the study?

Your participation in the study is voluntary and promises no financial benefit.

Right to refuse or withdraw:

Participation in this survey is voluntary and you can choose not to answer any individual question or all of the questions. However, we hope that you will participate in this survey since your views are important.

Who do I contact if I have a question or problem?

If you wish to know more about your rights as a participant in this study you may write the Bangladesh Medical Research Council (BMRC), Mohakhali, Dhaka or Mitra and Associates, Main Road 1, House 35, Senpara Parbata, Mirpur 10, Dhaka or Phone 9025410, 9025412. If you have further questions regarding the nature of this study you may also contact NIPORT, 13/1 Sheikh Shaheb Bazar, Azimpur, Dhaka-1205 or Phone 9662495, 58611206.

At this time, do you want to ask me anything about the survey? May I begin the interview now?

Signature of interviewer:

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
SECTION 2: BASIC INFORMATION ABOUT RESPONDENT			
201	RECORD THE TIME AT START OF INTERVIEW	<input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> HOUR MINUTES	
202	NAME OF THE RESPONDENT	NAME: _____	
203	What is your relationship to the (NAME)?	FATHER 1 MOTHER 2 SIBLING 3 NO RELATION 4 OTHER RELATIVE _____ 6 (SPECIFY)	
204	Did you live with (NAME) in the period leading to her/his death?	YES 1 NO 2	
SECTION 3: INFORMATION ON THE DECEASED AND DATE/PLACE OF DEATH			
301	COPY THE NAME OF THE DECEASED FROM Q212 OF WOMEN'S QUESTIONNAIRE	NAME: _____	
302	Was (NAME) female or male?	FEMALE 1 MALE 2 AMBIGIOUS/ INTERSEX 3	
303	When was (NAME) born? RECORD DATE OF BIRTH OF THE DISEASED FROM Q215 OF WOMEN'S QUESTIONNAIRE	<input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> DAY MONTH YEAR	
303A	During which season did (NAME) die?	SUMMER 1 MONSOON 2 AUTUMN 3 LATE AUTUMN 4 WINTER 5 SPRING 6 DON'T KNOW 8	
303B	Where did (NAME) die?	DISTRICT: <input type="text"/> <input type="text"/> UPAZILA: <input type="text"/> <input type="text"/> <input type="text"/>	
304	How old was (NAME) when s/he died? IF LESS THAN ONE DAY RECORD '00.'	DAY 1 <input type="text"/> <input type="text"/> MONTH 2 <input type="text"/> <input type="text"/>	
305	When did (NAME) die? RECORD '98' IF DON'T KNOW DAY OR MONTH. RECORD '9998' IF DON'T KNOW YEAR.	<input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> DAY MONTH YEAR	
306	INTERVIEWER: CHECK 304: AGE AT DEATH 29 DAYS TO LESS THAN 5 YEARS <input type="checkbox"/>	AGE AT DEATH 0-28 DAYS <input type="checkbox"/> → USE VA FORM 1 AGE AT DEATH 6 YEARS AND ABOVE <input type="checkbox"/> → END	
307	Where did (NAME) die?	HOSPITAL 1 OTHER HEALTH FACILITY 2 ON THE WAY TO HEALTH FACILITY OR TO A PROVIDER 3 HOME 4 OTHER _____ 6 (SPECIFY) DON'T KNOW 8	
307A	In the two weeks before death, did (s)he live with, visit, or care for someone who had any COVID-19 symptoms or a positive COVID-19 test?	YES 1 NO 2	

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
	<i>(Hint to the interviewer: COVID-19 symptoms include fever, difficulty breathing, cough, extreme fatigue, and changes in sense of smell or taste. In the case of neonates or young children, please omit "care for".)</i>	DON'T KNOW 8	
307B	In the two weeks before death, did (s)he travel to an area where COVID-19 is known to be present?	YES 1 NO 2 DON'T KNOW 8	

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
SECTION 4: RESPONDENT'S ACCOUNT OF ILLNESS/EVENTS LEADING TO DEATH			
401	Could you tell me about the illness/events that led to (NAME)'S death?		

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
402	CAUSE OF DEATH 1 ACCORDING TO RESPONDENT		
403	CAUSE OF DEATH 2 ACCORDING TO RESPONDENT		
403A	Are any of the following words of interest mentioned in the above narrative? ABDOMEN CANCER DEHYDRATION DENGUE FEVER DIARRHOEA FEVER HEART PROBLEMS JAUNDICE (YELLOW SKIN OR EYES) PNEUMONIA RASH NONE OF THE ABOVE WORDS WERE MENTIONED	A B C D E F G H I J K	
SECTION 5: HISTORY OF PREVIOUSLY KNOWN MEDICAL CONDITIONS			
501	I would like to ask you some questions concerning previously known medical conditions the deceased had injuries and accidents that the deceased suffered; and signs and symptoms that (NAME) had/showed when s/he was ill. Some of these questions may not appear to be directly related to his/her death. Please bear with me and answer all the questions. The answers will help us to get a clear picture of all possible symptoms that (NAME) had. Please tell me if the deceased suffer from any of the following illnesses:		
502	Heart disease?	YES 1 NO 2 DON'T KNOW 8	
503	Diabetes?	YES 1 NO 2 DON'T KNOW 8

SUMMARY INDICATORS

Appendix G

Indicator	Bangladesh Demographic and Health Survey								
	1993–94	1996–97	1999–00	2004	2007	2011	2014	2017–18	2022
Fertility									
Total fertility rate (TFR) 15–49	3.4	3.3	3.3	3.0	2.7	2.3	2.3	2.3	2.3
Adolescent fertility (15–19) ^a	33	36	35	33	33	30	31	27.7	23.5
Contraceptive prevalence rate (CPR)^b									
Any method	44.6	49.2	53.8	58.1	55.8	61.2	62.4	61.9	64.0
Any modern method	36.2	41.5	43.4	47.3	47.5	52.1	54.1	51.9	54.7
Pill	17.4	20.8	23.0	26.2	28.5	27.2	27.0	25.4	27.4
Injectables	4.5	6.2	7.2	9.7	7.0	11.2	12.4	10.7	11.4
Male condom	3.0	3.9	4.3	4.2	4.5	5.5	6.4	7.2	8.1
Female sterilization	8.1	7.6	6.7	5.2	5.0	5.0	4.6	4.8	4.5
Male sterilization	1.1	1.1	0.5	0.6	0.7	1.2	1.2	1.1	0.9
IUD	2.2	1.8	1.2	0.6	0.9	0.7	0.6	0.6	0.4
Implants	na	0.1	0.5	0.8	0.7	1.1	1.7	2.1	1.7
Contraceptive prevalence rate (modern methods) among married adolescents age 15–19									
	19.6	27.8	31.2	34.1	37.6	42.4	46.7	43.7	48.1
Contraceptive prevalence rate (modern methods) in low-performing divisions^b									
Sylhet	na	16.0	25.0	22.0	24.7	35.2	40.9	44.8	44.3
Chittagong	23.4	30.8	34.9	37.4	38.2	44.5	47.2	44.8	49.0
Unmet need for family planning^b									
Percentage of currently married women with unmet need for family planning	21.6	19.7	18.2	15.0	16.8	13.5	12.0	12.0	10.0
Fertility preferences^b									
Percentage of currently married women age 15–49 who want no more children ^c	57.9	58.8	60.0	60.1	62.5	64.9	62.5	59.9	57.2
Antenatal coverage									
Percentage of last live births in the 2 years preceding the survey for which women received ANC from a medically trained provider at least once	na	na	na	51.4	53.8	55.2	65.0	82.1	87.6
Antenatal care visits (4+)									
Percentage of last live births in the 2 years preceding the survey for which women had four or more ANC visits with any provider	na	na	na	16.8	22.9	26.9	31.5	45.8	40.5
Quality of antenatal care^d									
Percentage of last live births in the 2 years preceding the survey for which women received quality ANC	na	na	na	na	na	na	na	17.9	21.2
Skilled assistance at delivery									
Percentage of live births in the 2 years preceding the survey attended by a medically trained provider	na	na	na	16.1	22.7	33.1	44.4	53.9	69.9
Percentage of live births in the 2 years preceding the survey delivered in health facilities by wealth quintile									
Lowest quintile	na	na	na	3.2	7.0	10.4	16.5	26.8	42.4
Highest quintile	na	na	na	38.6	52.1	60.8	72.0	78.7	87.4
Total	na	na	na	12.2	18.9	30.7	39.5	50.6	64.7

SUMMARY INDICATORS—Continued

Indicator	Bangladesh Demographic and Health Survey								
	1993–94	1996–97	1999–00	2004	2007	2011	2014	2017–18	2022
Postnatal care (within 2 days of delivery)									
Percentage of last live births in the 2 years preceding the survey for which mother/child received PNC from a medically trained provider within 2 days of delivery									
Mother	na	na	na	na	na	28.4	37.3	52.5	55.2
Child	na	na	na	na	na	30.4	32.1	52.6	56.2
Percentage of last live births delivered at home in the 2 years preceding the survey for which mother/child received PNC from a medically trained provider within 2 days of delivery									
Mother	na	na	na	na	na	na	na	6.8	12.6
Child	na	na	na	na	na	na	na	7.0	12.1
Childhood mortality (3-year period preceding the survey)									
Neonatal mortality rate (NNMR)	48	44	43	40	29	28	29	27	20
Postneonatal mortality rate (PNNMR) ^e	33	35	24	25	16	9	11	9	5
Infant mortality rate (₁ q ₀)	81	79	67	65	46	37	40	36	25
Child mortality rate (₄ q ₁)	49	36	26	24	13	11	7	7	6
Under-5 mortality rate (₅ q ₀)	126	112	91	88	58	48	47	43	31
Treatment for diarrhea									
Percentage of children under age 5 with diarrhea treated with ORS or homemade solution	58.3	61.0	73.6	74.6	81.2	80.6	84.3	85.1	75.7
Percentage of children under age 5 with diarrhea treated with ORT and zinc	na	na	na	na	na	36.1	38.1	43.6	44.1
Nutritional status of children									
Percentage of children under age 5 clarified as malnourished according to three anthropometric indices of nutritional status ^f									
Height-for-age (stunting)									
Severe	na	na	na	22.1	16.1	15.3	11.6	8.9	5.7
Moderate or severe	na	na	na	50.6	43.2	41.3	36.1	30.8	23.6
Weight-for-height (wasting)									
Severe	na	na	na	3.4	2.9	4.0	3.1	1.5	1.8
Moderate or severe	na	na	na	14.5	17.4	15.6	14.3	8.4	11.0
Weight-for-age (underweight)									
Severe	na	na	na	13.6	11.8	10.4	7.7	4.1	4.4
Moderate or severe	na	na	na	42.5	41.0	36.4	32.6	21.9	22.3
Exclusive breastfeeding									
Percentage of children under age 6 months who are exclusively breastfed (based on 24-hour recall)	45.9	45.1	46.1	42.2	42.9	63.5	55.3	65.0	53.4
Infant and young child feeding (IYCF)									
Percentage of children age 6–23 months fed a minimum acceptable diet	na	na	na	na	na	20.9	22.8	35.4	29.6

na = not applicable

^a Percentage of women age 15–19 who have ever had a live birth or are currently pregnant

^b Rates for 2007, 2011, 2014, and 2017–18 are for currently married women age 15–49.

^c Want no more children or have been sterilized

^d Quality ANC is defined as four or more ANC visits with at least one to a medically trained provider, measurement of weight and blood pressure, testing of urine and blood, and receipt of information on danger signs during pregnancy.

^e Computed as the difference between the infant and neonatal mortality rates

^f Based on the WHO Child Growth Standards adopted in 2006
