The DHS Program
ICF
Rockville, Maryland, USA

March 2023

The 2021–22 Cambodia Demographic and Health Survey (2021–22 CDHS) was implemented by the National Institute of Statistics (NIS) in collaboration with the Ministry of Health. The funding for the CDHS was provided by the Royal Government of Cambodia (RGC), the United States Agency for International Development (USAID), the Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ), Australian Aid, the United Nations Population Fund (UNFPA), the United Nations Children’s Fund (UNICEF), and the World Food Programme (WFP). ICF provided technical assistance through The DHS Program, a USAID-funded project providing support and technical assistance in the implementation of population and health surveys in countries worldwide.

Additional information about the 2021–22 CDHS may be obtained from the National Institute of Statistics, 386 Monivong Boulevard, Sangkat Beong Keng Kang 1, Chamkar Mon, Phnom Penh, Cambodia; telephone: (855) 23-213650; email: linahang2002@gmail.com; internet: www.nis.gov.kh, or from the Directorate General for Health, Ministry of Health, 80 Samdech Penn Nouth Boulevard (289), Sangkat Boeungkak 2, Tuol Kork, Phnom Penh, Cambodia; telephone: (855) 23-885970/23-884909; email: webmaster@moh.gov.kh; internet: www.moh.gov.kh.

Information about The DHS Program may be obtained from ICF, 530 Gaither Road, Suite 500, Rockville, MD 20850, USA; telephone: +1-301-407-6500; fax: +1-301-407-6501; email: info@DHSprogram.com; internet: www.DHSprogram.com.

READING AND UNDERSTANDING TABLES FROM THE 2021–22 CAMBODIA DEMOGRAPHIC AND HEALTH SURVEY (CDHS)..... xxv	
SUSTAINABLE DEVELOPMENT GOALS INDICATORS.....	xxxiii
MAP OF CAMBODIA	xxxiv
1 INTRODUCTION AND SURVEY METHODOLOGY	1
1.1 Survey Objectives.....	1
1.2 Sample Design.....	1
1.3 Questionnaires	2
1.4 Anthropometry Measurement.....	3
1.5 Training of Trainers and Pretest	3
1.6 Training of Field Staff	3
1.6.1 Questionnaire Training	3
1.6.2 Anthropometry Training	4
1.6.3 CAPI Training.....	4
1.7 Fieldwork.....	5
1.8 Data Processing	5
1.9 Response Rates.....	5
2 HOUSING CHARACTERISTICS AND HOUSEHOLD POPULATION	7
2.1 Housing Characteristics.....	7
2.1.1 Use of Clean Fuels and Technologies.....	8
2.1.2 Cooking.....	8
2.1.3 Lighting.....	8
2.1.4 Primary Reliance on Clean Fuels and Technologies.....	8
2.2 Household Wealth	8
2.2.1 Household Durable Goods.....	8
2.2.2 Wealth Index.....	9
2.3 Household Population and Composition	9
2.4 Children’s Living Arrangements and Parental Survival.....	10
2.5 Birth Registration	10
2.6 Education.....	11
2.6.1 Educational Attainment	11
2.6.2 Primary and Secondary School Attendance	12
2.6.3 Participation Rate in Organized Learning among Children Age 5	13
3 CHARACTERISTICS OF RESPONDENTS	29
3.1 Basic Characteristics of Survey Respondents.....	29
3.2 Education and Literacy	29
3.3 Mass Media Exposure and Internet Usage	31
3.4 Employment	33
3.5 Occupation.....	33
3.6 Health Insurance Coverage.....	34
3.7 Tobacco Use	35

3.8	Alcohol Consumption.....	35
3.9	Residence at Birth and Recent Migration	36
3.9.1	Type of Migration	36
3.9.2	Reason for Migration	36
4	MARRIAGE AND SEXUAL ACTIVITY	69
4.1	Marital Status.....	69
4.2	Marriage Registration	70
4.3	Age at First Marriage.....	70
4.4	Age at First Sexual Intercourse	71
4.5	Recent Sexual Activity	72
5	FERTILITY.....	81
5.1	Current Fertility	81
5.2	Children Ever Born and Living	83
5.3	Birth Intervals.....	84
5.4	Insusceptibility to Pregnancy.....	85
5.5	Age of First Menstruation.....	86
5.6	Arrival of Menopause	86
5.7	Age at First Birth	86
5.8	Teenage Pregnancy.....	87
5.9	Pregnancy Outcomes and Induced Abortion Rates	89
6	FERTILITY PREFERENCES.....	103
6.1	Desire for Another Child	103
6.2	Ideal Family Size	104
6.3	Fertility Planning Status	105
6.4	Wanted Fertility Rates	106
7	FAMILY PLANNING	115
7.1	Contraceptive Knowledge and Use	115
7.1.1	Use of Emergency Contraception	117
7.1.2	Knowledge of the Fertile Period	117
7.2	Source of Modern Contraceptive Methods	118
7.3	Informed Choice	118
7.4	Discontinuation of Contraceptives	118
7.5	Demand for Family Planning	119
7.5.1	Decision Making about Family Planning and Opinion about Using Family Planning	121
7.5.2	Pressure to Become Pregnant and Future Use of Contraception	121
7.5.3	Exposure to Family Planning Messages	122
7.6	Contact of Nonusers with Family Planning Providers.....	122
8	INFANT AND CHILD MORTALITY.....	147
8.1	Infant and Child Mortality	148
8.2	Perinatal Mortality	150
8.3	High-risk Fertility Behavior	151
9	MATERNAL AND NEWBORN HEALTH CARE.....	157
9.1	Antenatal Care Coverage and Content	157
9.1.1	Skilled Providers.....	157
9.1.2	Timing and Number of ANC Visits.....	158
9.2	Components of ANC	158
9.2.1	Food or Cash Assistance, Deworming, and Iron-containing Supplementation during Pregnancy	160
9.2.2	Source of Iron-containing Supplements.....	160

9.3	Protection against Neonatal Tetanus	160
9.4	Delivery Services.....	161
9.4.1	Institutional Deliveries.....	161
9.4.2	Delivery by Cesarean	161
9.4.3	Skilled Assistance during Delivery	162
9.5	Postnatal Care.....	163
9.5.1	Postnatal Health Check for Mothers	163
9.5.2	Postnatal Health Check for Newborns	164
9.5.3	Postnatal Health Checks for Mothers and Newborns	165
9.6	Men's Involvement in Maternal Health Care	165
9.7	Breast and Cervical Cancer Examinations	165
9.8	Problems in Accessing Health Care	166
9.9	Distance and Means of Transport to the Nearest Health Facility	166
10	CHILD HEALTH.....	191
10.1	Child's Size and Birth Weight.....	191
10.2	Vaccination of Children.....	192
10.2.1	Vaccination Card Ownership and Availability	192
10.2.2	Basic Antigen Coverage	192
10.2.3	National Schedule Coverage	193
10.3	Symptoms of Acute Respiratory Infection (ARI) and Care-seeking Behavior	195
10.4	Fever and Care-seeking Behavior.....	196
10.5	Diarrheal Disease.....	196
10.5.1	Diarrhea and Care-seeking Behavior	196
10.5.2	Feeding Practices	197
10.5.3	Oral Rehydration Therapy, Zinc, Continued Feeding, and Other Treatments ...	198
11	NUTRITION OF CHILDREN AND WOMEN.....	215
11.1	Nutritional Status of Children.....	216
11.2	Growth Monitoring and Promotion	219
11.3	Infant and Young Child Feeding Practices	220
11.3.1	Ever Breastfed, Early Initiation of Breastfeeding, and Exclusive Breastfeeding for the First 2 Days after Birth	220
11.3.2	Exclusive Breastfeeding and Mixed Milk Feeding	221
11.3.3	Continued Breastfeeding and Bottle Feeding	222
11.3.4	Introduction of Complementary Foods	222
11.3.5	Minimum Dietary Diversity, Minimum Meal Frequency, Minimum Milk Feeding Frequency, Minimum Acceptable Diet, and Egg and/or Flesh Food Consumption.....	223
11.3.6	Sweet Beverage Consumption, Unhealthy Food Consumption, and Lack of Vegetable or Fruit Consumption among Children	225
11.3.7	Infant and Young Child Feeding (IYCF) Indicators	226
11.4	Infant and Young Child Feeding Counseling	226
11.5	Micronutrient Supplementation and Deworming among Children	227
11.6	Adults' Nutritional Status.....	228
11.7	Women's Dietary Practices	230
11.8	Presence of Iodized Salt in Households.....	232

12	CHILD DISCIPLINE	253
12.1	Sub-class and Forms of Disciplinary Practices.....	253
12.2	Belief in Physical Punishment.....	255
13	KNOWLEDGE, ATTITUDES, AND BEHAVIOR RELATED TO HIV AND AIDS	261
13.1	Knowledge and Attitudes about Medicines to Treat or Prevent HIV	261
13.2	Discriminatory Attitudes towards People Living with HIV	262
13.3	Multiple Sexual Partners	263
13.4	Coverage of HIV Testing Services.....	264
13.4.1	HIV Testing of Pregnant Women	264
13.4.2	Experience with Prior HIV Testing	264
13.5	Disclosure, Shame, and Stigma among HIV-positive Respondents	265
13.6	Male Circumcision	266
13.7	Self-reporting of Sexually Transmitted Infections	267
13.8	HIV/AIDS-related Knowledge and Behavior among Young People	267
13.8.1	Knowledge about HIV Prevention.....	267
13.8.2	First Sex	268
13.8.3	Premarital Sex.....	268
13.8.4	Multiple Sexual Partners.....	268
13.8.5	Recent HIV Testing	269
14	DOMESTIC VIOLENCE.....	287
14.1	Measurement of Violence.....	288
14.2	Women's Experience of Physical Violence	289
14.2.1	Perpetrators of Physical Violence	289
14.2.2	Experience of Physical Violence during Pregnancy	290
14.3	Experience of Sexual Violence.....	290
14.3.1	Prevalence of Sexual Violence	290
14.3.2	Perpetrators of Sexual Violence.....	291
14.3.3	Experience of Sexual Violence by a Non-intimate Partner.....	291
14.4	Experience of Different Forms of Violence	291
14.5	Forms of Controlling Behaviors and Intimate Partner Violence	291
14.5.1	Prevalence of Controlling Behaviors and Intimate Partner Violence	292
14.5.2	Intimate partner violence in the last 12 months perpetrated by any husband/intimate partner.....	295
14.6	Injuries to Women due to Intimate Partner Violence	296
14.7	Violence Initiated by Women against Husbands or Intimate Partners	296
14.8	Help Seeking among Women Who Have Experienced Violence.....	297
14.9	Intimate Partner Violence during the COVID-19 Pandemic	297
15	WOMEN'S EMPOWERMENT	319
15.1	Married Women's and Men's Employment	320
15.2	Control over Women's Earnings	320
15.3	Control over Men's Earnings	321
15.4	Women's and Men's Ownership of Assets	322
15.4.1	Ownership of a House or Land and Documentation of Ownership	322
15.4.2	Ownership and Use of Mobile Phones and Bank Accounts.....	323
15.5	Participation in Decision Making	324
15.6	Attitudes toward Wife Beating	325
15.7	Negotiating Sexual Relations	326
15.8	Women's Participation in Decision Making regarding Sexual and Reproductive Health.....	326

16	HOUSEHOLD WATER AND SANITATION	347
16.1	Drinking Water Sources, Availability, and Treatment	347
16.1.1	Drinking Water Service Ladder	348
16.1.2	Person Collecting Drinking Water.....	350
16.1.3	Availability of Drinking Water	351
16.1.4	Treatment of Drinking Water.....	351
16.2	Sanitation.....	351
16.2.1	Sanitation Service Ladder	352
16.2.2	Removal and Disposal of Excreta.....	353
16.3	Disposal of Children’s Stools	354
16.4	Handwashing	355
16.5	Menstrual Hygiene	355
17	DISABILITY	371
17.1	Disability by Domain and Age	371
17.2	Disability among Adults by Other Background Characteristics	372
18	ADULT AND MATERNAL MORTALITY	377
18.1	Data	377
18.2	Direct Estimates of Adult Mortality	378
18.3	Trends in Adult Mortality.....	379
18.4	Direct Estimates of Maternal Mortality	379
18.5	Trends in Pregnancy-related Mortality	380

FOREWORD

The 2021–22 Cambodia Demographic and Health Survey (2021–22 CDHS) is the fifth survey of its kind to be conducted successfully in Cambodia, following those implemented in 2000, 2005, 2010, and 2014. The National Institute of Statistics (NIS) of the Ministry of Planning, in collaboration with the Ministry of Health (MoH), implemented the survey. Funding for the 2021–22 CDHS was provided by the Royal Government of Cambodia (RGC), the United States Agency for International Development (USAID), the Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ), Australian Aid, the United Nations Population Fund (UNFPA), the United Nations Children’s Fund (UNICEF), and the World Food Programme (WFP). ICF provided technical assistance through The DHS Program, which assists countries in collecting data to monitor and evaluate population, health, and nutrition programs.

This report provides reliable and detailed information on sociodemographic characteristics of the household population, disability, fertility, family planning, infant and child mortality, maternal mortality, and health-related information such as breastfeeding, antenatal care, delivery, children’s immunization, maternal health, child health and nutrition, child discipline, knowledge of HIV/AIDS, women’s empowerment, and domestic violence. In addition, the report describes indicators related to Sustainable Development Goals.

I am gratified that the 2021–22 CDHS has been a success and that reliable and timely data have been made available to specialized users and national and international institutions to develop, monitor, and evaluate policies and programs in the fields of health (particularly reproductive health and maternal and child health), population, and development.

On behalf of the Ministry of Planning, I would like to express our deep gratitude to Samdech Akka Moha Sena Padei Techo Hun Sen, Prime Minister of the Kingdom of Cambodia. His unwavering support has been integral to the successful completion of this project. I would also like to extend our sincerest thanks to His Excellency Akka Pundit Sapheacha Aun Pornmoniroth, Deputy Prime Minister and Minister of Economy and Finance of the Royal Government of Cambodia, who authorized the use of the national budget and facilitated the timely release of funding.

In addition, I thank the United States Agency for International Development, the Deutsche Gesellschaft für Internationale Zusammenarbeit, Australian Aid, the United Nations Population Fund, the United Nations Children’s Fund, the World Food Programme, and ICF International for providing technical assistance.

I would like to thank Dr. Rathavuth Hong and Ms. Lady Ortiz Parra for providing technical support in all stages of the survey. I gratefully acknowledge the support and encouragement extended by the Minister of Health and Minister of Planning as well as other members of the 2021–22 CDHS Executive Committee and Technical Committee who contributed to the survey activities.

I would like to express my gratitude and appreciation to all staff of the National Institute of Statistics and to Her Excellency Ms. Hang Lina, Delegate of the Royal Government of Cambodia in-charge of Director-General of the National Institute of Statistics, and His Excellency Dr. Lo Veasnakiry, Secretary of State of the Ministry of Health, who coordinated the survey operations. I express particular thanks to all of the survey respondents who supported and participated in the 2021–22 CDHS.

Last but not least, I would like to express my thanks to the technical working group members of the National Institute of Statistics, the Ministry of Planning, the Ministry of Health, the Ministry of Women’s Affairs, the Provincial Planning Department, and the Provincial Health Department; the local authorities; and the field coordinators.

We are pleased to present this report to the line ministries and to international agencies, nongovernmental organizations, policymakers, program implementers, development planners, and researchers. We hope that the report will provide useful information to address intervention concerns and future planning in the health sector.

A handwritten signature in blue ink, appearing to read "Kitti Settha Pandita Chhay Than".

Kitti Settha Pandita Chhay Than

Senior Minister

Minister of Planning

ACKNOWLEDGMENTS

The 2021–22 Cambodia Demographic and Health Survey (CDHS) was successfully completed due to the efforts and involvement of numerous organizations and individuals. We are grateful to the National Institute of Statistics of the Ministry of Planning for implementing the survey and to the Ministry of Health for its guidance and support. We would like to express our deepest gratitude to Samdech Akka Moha Sena Padei Techo Hun Sen, Prime Minister of the Kingdom of Cambodia, for unwavering support that was integral to the successful completion of the survey. In addition, we extend our sincerest thanks to His Excellency Akka Pundit Sapheacha Aun Pornmoniroth, Deputy Prime Minister and Minister of Economy and Finance of the Royal Government of Cambodia, for authorizing the use of the national budget and facilitating the timely release of funding.

We would like to extend special thanks to His Excellency Kitti Settha Pandita Chhay Than, Honorable Senior Minister and Minister of Planning, whose keen interest in censuses and surveys was always a source of inspiration and encouragement to the project staff. We express our sincere gratitude to all of the members of the Executive Committee and the Technical Committee for their contributions and valuable guidance.

We appreciate and acknowledge the untiring efforts and initiative taken by ICF staff members Dr. Rathavuth Hong and Ms. Lady Ortiz Parra in supporting the National Institute of Statistics throughout the project. We also acknowledge generous financial and technical support from our development partners, including the United States Agency for International Development (USAID), the Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ), Australian Aid, the United Nations Population Fund (UNFPA), the United Nations Children’s Fund (UNICEF), and the World Food Programme (WFP).

We would like to thank the staff members of the National Institute of Statistics, the Ministry of Planning, the Ministry of Health, the Ministry of Women’s Affairs, the Provincial Planning Department, the Provincial Health Department, and the local authorities. We would like to especially express our appreciation to the fieldworkers and field coordinators who worked tirelessly and overcame several challenges to collect quality data. Last but not least, we sincerely thank all of the survey respondents who provided their valuable time participating in the interviews.

Her Excellency Hang Lina
Director General of the National Institute of Statistics

His Excellency Dr. Lo Veasnakiry
Secretary of State, Ministry of Health

ACRONYMS AND ABBREVIATIONS

AIDS	acquired immunodeficiency syndrome
ANC	antenatal care
ARI	acute respiratory infection
ART	antiretroviral therapy
ASFR	age-specific fertility rates
BCG	bacillus Calmette-Guérin
BMI	body mass index
CAPI	computer-assisted personal interviewing
CBR	crude birth rate
CDC	Centers for Disease Control
CDHS	Cambodia Demographic and Health Survey
CGPC	Cambodia General Population Census
COVID	corona virus disease 2019
CPR	contraceptive prevalence
DEFT	design effect
DHS	Demographic and Health Survey
DPT	diphtheria, pertussis, tetanus
EA	enumeration area
EIBF	early initiation of breastfeeding
GAR	gross attendance ratio
GFR	general fertility rate
GIZ	Deutsche Gesellschaft für Internationale Zusammenarbeit
GPC	General Population Census
GPI	gender parity index
HepB	hepatitis B
Hib	Haemophilus influenzae type b
HIV	human immunodeficiency virus
HPV	human papillomavirus
IMCI	integrated management of childhood illness
IPV	inactivated polio vaccine
ISSSF	introduction of solid, semisolid, or soft foods
IUD	intrauterine device
IYCF	infant and young child feeding
JMP	Joint Monitoring Programme for Water Supply, Sanitation and Hygiene

LAM	lactational amenorrhea method
LPG	liquefied petroleum gas
MoH	Ministry of Health
MR	measles-rubella
MTCT	mother-to-child transmission
MUAC	mid-upper-arm circumference
NAR	net attendance ratio
NGO	non-governmental organization
NIS	National Institute of Statistics
OPV	oral polio vaccine
ORS	oral rehydration salts
ORT	oral rehydration therapy
PCV	pneumococcal conjugate vaccine
PEP	postexposure prophylaxis
PrEP	pre-exposure prophylaxis
PRMR	pregnancy-related mortality ratio
PSU	primary sampling unit
RGC	Royal Government of Cambodia
RHF	recommended homemade fluids
SDG	Sustainable Development Goal
SDM	standard days method
SE	standard error
SE/R	relative standard error
STI	sexually transmitted infections
TAR	total abortion rate
TFR	total fertility rate
UNFPA	United Nations Population Fund
UNICEF	United Nations Children's Fund
USAID	United States Agency for International Development
VIA	visual inspection with acetic acid
VIP	ventilated improved pit
WFP	World Food Programme
WG	Washington Group on Disability Statistics
WHO	World Health Organization

READING AND UNDERSTANDING TABLES FROM THE 2021–22 CAMBODIA DEMOGRAPHIC AND HEALTH SURVEY (CDHS)

The 2021–22 Cambodia DHS final report is based on approximately 200 tables of data. For quick reference, they are located at the end of each chapter and can be accessed through links in the pertinent text (electronic version). Additionally, this report features about 90 figures that clearly highlight trends, subnational patterns, and background characteristics. Large, colorful maps display breakdowns for provinces in Cambodia. The text has been simplified to highlight key points in bullets and to clearly identify indicator definitions in boxes.

While the text and figures featured in each chapter highlight some of the most important findings from the tables, not every finding can be discussed or displayed graphically. For this reason, CDHS data users should be comfortable reading and interpreting tables.

The following pages provide an introduction to the organization of CDHS tables, the presentation of background characteristics, and a brief summary of sampling and understanding denominators. In addition, this section provides some exercises for users as they practice their new skills in interpreting CDHS tables.

4.2 MARRIAGE REGISTRATION

Registered marriage

A woman whose marriage is registered with the civil authorities regardless of whether she has a marriage certificate.

Sample: Currently married women age 15–49 does not include women who are living together with a man as if married but do not report themselves to be married.

Seventy-five percent of women who are married have registered with the civil authorities; however, only 51% have a marriage certificate (**Table 4.2**).

4.3 AGE AT FIRST MARRIAGE

Median age at first marriage

Age by which half of respondents have been married.

Sample: Women and men age 20–49, 25–49 and 30–49

Median ages at first marriage are 21.5 years among women age 25–49, 24.4 years among men age 25–49 (**Figure 4.2**). This finding contradicts the fact that women tend to marry earlier than men. Nineteen percent of women age 25–49 and only 6% of men age 25–49 marry before their 18th birthday (**Table 4.3**).

Trends: The median age at first marriage among women age 25–49 has increased by 1 year since 2014, from 20.5 years to 21.5 years, while the median age among men has increased from 23.0 years to 24.4 years. The percentage of respondents who were married before age 18 has declined from 25% to 19% among women and from 9% to 6% among men.

Patterns by background characteristics

- Rural women age 25–49 marry at a younger age than their urban counterparts (20.9 years versus 22.3 years) (**Table 4.4** and **Figure 4.3**).
- Women in Ratanak Kiri marry at a much earlier age (18.8 years) than women in Phnom Penh (23.0 years) (**Table 4.4**).
- Women in the lowest wealth quintile marry almost 2 years earlier than women in the highest quintile (20.7 years versus 22.5 years) (**Table 4.4**).

Figure 4.2 Median age at first sex and first marriage

Median age in years

■ Women age 25–49 ■ Men age 25–49

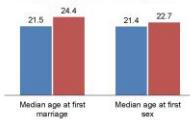

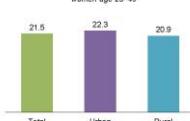

Figure 4.3 Women's median age at marriage by residence

Median age at first marriage among women age 25–49

■ Total ■ Urban ■ Rural

Example 1: Exposure to mass media: Women

A Question Asked of All Survey Respondents

Table 3.4.1 Exposure to mass media: Women

Percentage of women age 15–49 who are exposed to specific media on a weekly basis, according to background characteristics, Cambodia DHS 2021–22

Background characteristic	3	Reads a newspaper at least once a week	Watches television at least once a week	Listens to the radio at least once a week	Accesses all three media at least once a week	Accesses none of the three media at least once a week	2	1

Step 1: Read the title and subtitle, highlighted in orange in the table above. They tell you the topic and the specific population group being described. In this case, the table is about women age 15–49 and their exposure to different types of media. All eligible female respondents age 15–49 were asked these questions.

Step 2: Scan the column headings—highlighted in green in Example 1. They describe how the information is categorized. In this table, the first three columns of data show different types of media that women access at least once a week. The fourth column shows women who access all three types of media, while

the fifth column shows women who do not access any of the three types of media on a weekly basis. The last column lists the number of women age 15–49 interviewed in the survey.

Step 3: Scan the row headings—the first vertical column highlighted in blue in Example 1. These show the different ways the data are divided into categories based on population characteristics. In this case, the table presents women’s exposure to media by age, urban-rural residence, province, level of education, and wealth quintile. Most of the tables in the CDHS report will be divided into these same categories.

Step 4: Look at the row at the bottom of the table highlighted in pink. These percentages represent the totals of all women age 15–49 and their weekly access to different types of media. In this case, 7.6%* of women age 15–49 read a newspaper at least once a week, 22.3% watch television at least weekly, and 5.0% listen to the radio on a weekly basis.

Step 5: Draw two imaginary lines, as shown on the table, to find out what percentage of women with more than a secondary education have access to all three media at least once a week. This shows that 3.1% of women age 15–49 with more than a secondary education have access to all three media at least once a week.

By looking at patterns by background characteristics, we can see how exposure to mass media varies across Cambodia. Mass media are often used to communicate health messages. Knowing how mass media exposure varies among different groups can help program planners and policymakers determine how to most effectively reach their target populations.

* For the purpose of this document data are presented exactly as they appear in the table, including decimal places. However, the text in the remainder of this report rounds data to the nearest whole percentage point.

Practice: Use the table in Example 1 to answer the following questions:

- What percentage of women in Cambodia do not access any of the three media at least once a week?
- Which province has the highest percentage of women who access all three media at least once a week?
- Compare women in urban areas to women in rural areas—which group is more likely to read a newspaper at least once a week?
- Is there a clear pattern in exposure to all three media by wealth quintile?
- What are the lowest and highest percentages (the range) of women who watch television at least once a week by age?
- Is there a clear pattern in exposure to newspapers on a weekly basis by educational level?

- Answers:
a) 71.69%
b) The province with the highest percentage of women age 15–49 who access all three media weekly is Preah Sihanouk (26.9%).
c) Women in urban areas: 11.1% of urban women read a newspaper at least once a week, as compared with 5.1% of rural women.
d) Yes, exposure to all three media increases with increasing wealth; 0.5% of women age 15–49 in the lowest wealth quintile access all three media at least once a week, compared with 2.5% of women in the highest quintile.
e) By age, the percentage of women who watch television at least once a week ranges from a low of 18.8% among those age 20–24 to a high of 27.6% among those age 45–49.
f) Yes, the percentage of women who read a newspaper on a weekly basis increases with increasing education, from 0.1% among those with no education to 23.2% among those with more than a secondary education.

Example 2: Alcohol consumption: Women

A Question Asked of a Subgroup of Survey Respondents

Table 3.14.1 Alcohol consumption: Women

1

Percentage of women age 15–49 who consumed at least one alcoholic drink in the month prior to the survey, and among women who consumed at least one alcoholic drink in the past month, percent distribution by frequency of drinking (number of days on which at least one drink was consumed), according to background characteristics, Cambodia DHS 2021–22

Background characteristic	Consumed at least one alcoholic drink in the past month	Number of women	Among women who consumed at least one alcoholic drink in the past month, percent distribution by frequency of drinking					Number of women who consumed at least one alcoholic drink in the past month

Highest	17.9	4,477	88.6	3.3	2.1	5.9	100.0	800	
Total	3 (16.3)	19,496	85.1	3.4	2.2	9.4	100.0	3 (3,173)	

Note: One drink of alcohol corresponds to one can or bottle of beer, one glass of wine, or one shot of spirits. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ The respondent reported that she drank alcohol every day, almost every day, or 25 or more days in the past month.

Step 1: Read the title and subtitle. In this case, the table is about two separate groups of women: all women age 15–49 (a) and women age 15–49 who consumed at least one alcoholic drink in the month before the survey (b).

Step 2: Identify the two panels. First, identify the columns that refer to all women age 15–49 (a), and then isolate the columns that refer only to women age 15–49 who consumed at least one alcoholic drink in the month before the survey (b).

Step 3: Look at the first panel. What percentage of women consumed at least one alcoholic drink in the month before the survey? It is 16.3%. Now look at the second panel. How many women consumed at least one alcoholic drink in the month before the survey? It's 3,173, or 16.3% of the 19,496 women age 15–49 (with rounding). The second panel is a subset of the first panel.

Step 4: A total of 3,173 women consumed at least one alcoholic drink in the month before the survey. Once these women are further divided into the background characteristic categories, there may be too few cases for the percentages to be reliable.

- Among women in Pursat who consumed at least one alcoholic drink in the month before the survey, what percentage drank alcohol between 11 and 24 days of the month? The answer is 1.4%. This percentage is in parentheses because there are between 25 and 49 women (unweighted) in this category. Readers should use this number with caution—it may not be reliable. (For more information on weighted and unweighted numbers, see Example 3.)
- Among women in Koh Kong who consumed at least one alcoholic drink in the month before the survey, what percentage consumed an alcoholic drink every day or almost every day? There is no number in this cell—only an asterisk. This is because there are fewer than 25 unweighted cases. Results for this group are not reported. The subgroup is too small, and therefore the data are not reliable.

Note: When parentheses or asterisks are used in a table, the explanation will be noted under the table. If there are no parentheses or asterisks in a table, you can proceed with confidence that enough cases were included in all categories that the data are reliable.

Example 3: Understanding Sampling Weights in CDHS Tables

A sample is a group of people who have been selected for a survey. In the CDHS, the sample is designed to represent the national population age 15–49. In addition to national data, most countries want to collect and report data on smaller geographical or administrative areas. However, doing so requires a large enough sample size in each area. For the 2021–22 CDHS, the survey sample is representative at the national and provincial levels and for urban and rural areas.

To generate statistics that are representative of the country as a whole and the 25 provinces, the number of women surveyed in each province should contribute to the size of the total (national) sample in proportion to size of the province. However, if some provinces have small populations, then a sample allocated in proportion to each province's population may not include sufficient women from each province for analysis. To solve this problem, provinces with small populations are oversampled. For example, let's say that you have enough money to interview 19,496 women and want to produce results that are representative of Cambodia as a whole and its provinces (as in Table 3.1). However, the total population of Cambodia is not evenly distributed among the provinces: some provinces, such as Phnom Penh, are heavily populated while others, such as Pursat, are not. Thus, Pursat must be oversampled.

A sampling statistician determines how many women should be interviewed in each province in order to get reliable statistics. The **blue column (1)** in the table at the right shows the actual number of women interviewed in each province. Within the provinces, the number of women interviewed ranges from 504 in Pursat to 1,073 in Phnom Penh. The number of interviews is sufficient to get reliable results in each province.

With this distribution of interviews, some provinces are overrepresented and some provinces are underrepresented. For example, the population in Phnom Penh is about 16% of the population in Cambodia, while Pursat's population contributes only 2% of the population in Cambodia. But as the blue column shows, the number of women interviewed in Phnom Penh accounts for only about 6% of the total sample of women interviewed (1,073/19,496) and the number of women interviewed in Pursat accounts for 3% (504/19,496) of the women interviewed. Thus, this unweighted distribution of women does not accurately represent the population of Cambodia.

In order to get statistics that are representative of Cambodia, the distribution of the women in the sample needs to be weighted (or mathematically adjusted) such that it resembles the true distribution in the country. Women from a small province, like Pursat, should contribute only a small amount to the national total. Women from the capital city, Phnom Penh, should contribute much more. Therefore, DHS statisticians mathematically calculate a “weight” that is used to adjust the number of women from each province so that each province's contribution to the total is proportional to the actual population of the province. The numbers in the **purple column (2)** represent the “weighted” values. The weighted values can be smaller or larger than the unweighted values at the provincial level. The total national sample size of 19,496 women has not changed after weighting, but the distribution of the women in the provinces has been changed to represent their contribution to the total population size.

Table 3.1 Background characteristics of respondents

Percent distribution of women age 15–49 by selected background characteristics, Cambodia DHS 2021–22

Background characteristic	Women		
	Weighted percent	Weighted number	Unweighted number
Province			
Banteay Meanchey	3.9	763	686
Battambang	6.9	1,347	845
Kampong Cham	6.0	1,163	743
Kampong Chhnang	3.5	675	769
Kampong Speu	6.3	1,226	890
Kampong Thom	4.2	819	770
Kampot	4.0	781	805
Kandal	7.4	1,445	887
Koh Kong	0.7	140	681
Kratie	2.3	443	670
Mondulkiri	0.6	115	827
Phnom Penh	16.2	3,160	1,073
Preah Vihear	1.7	332	846
Prey Veng	6.3	1,233	848
Pursat	2.2	432	504
Ratanak Kiri	1.5	293	730
Siemreap	7.9	1,548	898
Preah Sihanouk	1.2	243	701
Stung Treng	1.0	195	809
Svay Rieng	3.8	735	784
Takeo	6.0	1,162	866
Otdar Meanchey	1.2	242	712
Kep	0.3	57	746
Pailin	0.5	96	656
Tboung Khmum	4.4	851	750
Total	100.0	19,496	19,496

How do statisticians weight each category? They take into account the probability that a woman was selected in the sample. If you were to compare the **green column (3)** to the actual population distribution of Cambodia, you would see that women in each province are contributing to the total sample with the same weight that they contribute to the population of the country. The weighted number of women in the survey now accurately represents the proportion of women who live in Pursat and the proportion of women who live in Phnom Penh.

With sampling and weighting, it is possible to interview enough women to provide reliable statistics at national and provincial levels. In general, only the weighted numbers are shown in each of the CDHS tables, so don't be surprised if these numbers seem low: they may actually represent a larger number of women interviewed.

Sustainable Development Goals Indicators—Cambodia DHS 2021–22

Indicator	Residence			DHS table number
	Urban	Rural	Total	
1. No poverty				
1.4.1 Proportion of population living in households with access to basic services

17.8.1 Proportion of individuals using the Internet ¹⁵	76.4	63.7	70.0 ^a	3.5.1, 3.5.2

na = not applicable

¹ Persons living in households that report the primary source of lighting is electricity.

² Persons living in households that report no cooking, no space heating, or no lighting are not excluded from the numerator.

³ Expressed in terms of maternal deaths per 100,000 live births in the 7-year period preceding the survey

⁴ Expressed in terms of deaths per 1,000 live births for the 5-year period preceding the survey

⁵ Data are not age-standardized and are available for women and men age 15–49 only.

⁶ The percentage of children age 12–23 months who received three doses of DPT-HepB-Hib vaccine

⁷ The percentage of children age 24–35 months who received two doses of measles-rubella vaccine

⁸ The percentage of children age 12–23 months who received a three doses of pneumococcal vaccine

⁹ Data are available for women age 15–49 who have ever been in union only.

¹⁰ In the DHS, psychological violence is termed emotional violence.

¹¹ Data are available for currently married women only.

¹² Data are available for women and men age 15–49 only.

¹³ Data are available for children age 1–14 only.

¹⁴ Data are available for women only age 15–49.

¹⁵ Data are available for women and men age 15–49 who have used the Internet in the last 12 months.

^a The total is calculated as the simple arithmetic mean of the percentages in the columns for males and females.

CAMBODIA

INTRODUCTION AND SURVEY METHODOLOGY

The 2021–22 Cambodia Demographic and Health Survey (2021–22 CDHS) was implemented by the National Institute of Statistics (NIS) in collaboration with the Ministry of Health (MoH). Data collection took place from September 15, 2021, to February 15, 2022. ICF provided technical assistance through The DHS Program, which is funded by the United States Agency for International Development (USAID) and offers financial support and technical assistance for population and health surveys in countries worldwide. Other agencies and organizations that facilitated the successful implementation of the survey through technical or financial support were the Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ), Australian Aid, the United Nations Population Fund (UNFPA), the United Nations Children’s Fund (UNICEF), and the World Food Programme (WFP).

1.1 SURVEY OBJECTIVES

The primary objective of the 2021–22 CDHS is to provide up-to-date estimates of basic demographic and health indicators. Specifically, the survey collected information on fertility, awareness and use of family planning methods, breastfeeding practices, nutritional status of women and children, maternal and child health, adult and childhood mortality, women’s empowerment, domestic violence, awareness and behavior regarding HIV/AIDS and other sexually transmitted infections (STIs), and other health-related issues such as smoking.

The information collected through the 2021–22 CDHS is intended to assist policymakers and program managers in evaluating and designing programs and strategies for improving the health of Cambodia’s population. The survey also provides data on indicators relevant to the Sustainable Development Goals (SDGs) for Cambodia.

1.2 SAMPLE DESIGN

The sampling frame used for the 2021–22 CDHS is the 2019 General Population Census (GPC) of Cambodia, which was conducted by the NIS. The sampling frame is a complete list of enumeration areas (EAs) covering the entire country provided by the NIS, the implementing agency for the CDHS. An EA is a natural village—or part of a village—created for the 2019 GPC that served as the counting unit for the census.

The 2021–22 CDHS followed a two-stage sample design and was intended to allow estimates of key indicators at the national level as well as for urban and rural areas and each of Cambodia’s 25 provinces. The first stage involved the selection of sample points (clusters) consisting of EAs delineated for the 2019 GPC. A total of 709 clusters were selected, 241 in urban areas and 468 in rural areas. (The 2019 GPC reclassified about 20% of rural EAs as urban EAs.)

The second stage involved systematic sampling of households. A household listing operation was undertaken in all selected EAs from April to August 2021, and households to be included in the survey were randomly selected from these lists. Thirty households were selected from each cluster, for a total sample size of 21,270 households. Because of the approximately equal sample sizes in each province, the sample is not self-weighting at the national level, and weighting factors have been calculated and added to the data file so that the results will be proportional at the national level.

All women age 15–49 who were either permanent residents of the selected households or visitors who stayed in the household the night before the survey were eligible to be interviewed. In half of the households, all men age 15–49 who were either permanent residents of the selected households or visitors

who stayed in the household the night before the survey were eligible to be interviewed. In the subsample of households not selected for the male survey, height, weight, and mid-upper-arm circumference measurements were performed among women age 15–49 and children under age 5.

1.3 QUESTIONNAIRES

Four questionnaires were used in the 2021–22 CDHS: the Household Questionnaire, the Woman’s Questionnaire, the Man’s Questionnaire, and the Biomarker Questionnaire. The questionnaires, based on The DHS Program’s model questionnaires, were adapted to reflect the population and health issues relevant to Cambodia. In addition, a self-administered Fieldworker Questionnaire collected information about the survey’s fieldworkers.

The Household Questionnaire listed all members of and visitors to the selected households. Basic demographic information was collected on each person listed, including age, sex, marital status, education, and relationship to the head of the household. For children under age 18, survival status of parents was determined. Data on age, sex, and marital status of household members were used to identify women and men who were eligible for individual interviews. The Household Questionnaire also collected information on characteristics of the household’s dwelling unit, such as source of drinking water; type of toilet facilities; materials used for flooring, external walls, and roofing; and ownership of various durable goods. In addition, the questionnaire included modules on disability and child discipline.

The Woman’s Questionnaire was used to collect information from all eligible women age 15–49. These women were asked questions on the following topics:

- Background characteristics (including age, education, and media exposure)
- Pregnancy history and child mortality
- Knowledge, use, and source of family planning methods
- Antenatal, delivery, and postnatal care
- Vaccinations and childhood illnesses
- Breastfeeding and infant feeding practices
- Women’s minimum dietary diversity
- Marriage and sexual activity
- Fertility preferences (including desire for more children and ideal number of children)
- Women’s work and husbands’ background characteristics
- Knowledge, awareness, and behavior regarding HIV/AIDS and other sexually transmitted infections (STIs)
- Knowledge, attitudes, and behavior related to other health issues (for example, smoking)
- Adult and maternal mortality
- Domestic violence

The Man’s Questionnaire was administered to all men age 15–49 in the subsample of households selected for the men’s survey. The Man’s Questionnaire collected much of the same information as the Woman’s Questionnaire but was shorter because it did not contain a detailed reproductive history or questions on maternal and child health.

The Biomarker Questionnaire was used to record the results of anthropometry measurements for women and children. This questionnaire was administered only to the subsamples selected for the respective biomarker component.

The purpose of the Fieldworker Questionnaire was to collect basic background information on the people who were collecting data in the field, including team supervisors, interviewers, and biomarker technicians.

1.4 ANTHROPOMETRY MEASUREMENT

Weight measurements were taken using mother/child scales with a digital display (UNICEF model S0141025). Height and length were measured using a portable baby/adult length-height measurement system (UNICEF model S0114540). Children younger than age 24 months were measured lying down (recumbent length), while older children and women were measured standing up (height). Mid-upper-arm circumference (MUAC) was measured using new standard MUAC tape (UNICEF model S0145620).

To assess the precision of height measurements, about 10% of children were randomly selected to be measured a second time. The DHS Program defines a difference of less than 1 centimeter between the two height measurements as an acceptable level of precision. Children with a z score of less than -3 or more than 3 for height-for-age, weight-for-height, or weight-for-age were flagged and measured a second time. The remeasurement of flagged cases was performed to ensure accurate reporting of height and weight measurements.

1.5 TRAINING OF TRAINERS AND PRETEST

The pretest for the 2021–22 CDHS was implemented from June 2 to 28, 2021. The first 2 weeks were allocated for paper questionnaire training, followed by 3 days for training on computer-assisted personal interviewing (CAPI) and 2 days for field practice. ICF technical assistance was provided virtually.

Questionnaire Training

Thirty candidates participated in questionnaire training: 13 women and 17 men (20 interviewers, five supervisors, and five biomarker technicians). Five NIS coordinators and one ICF staff member conducted the questionnaire training. The anthropometry measurement training was conducted separately by UNICEF—and in parallel to the questionnaire training—for five technicians. All 30 candidates were expected to return to participate in the main survey.

The training was conducted in Khmer. Mock interviews were organized at the end of training. Each trainee completed one Household Questionnaire and two individual questionnaires. The data collected during the practice exercises were later used in training sessions to test the CAPI programs and to practice collecting data on the tablets. Coordinators from the Ministry of Health provided training on various health topics including nutrition, HIV/AIDS, child vaccinations, and family planning and reproductive health.

The training of trainers for CAPI was conducted from June 16 to 22, 2021, for five NIS staff members, and CAPI pretest training was conducted from June 23 to 25 for 30 participants including the biomarker technicians.

Interviewers and biomarker technicians conducted a 2-day fieldwork practice session to solidify skills learned during the pretest training and to provide a simulated fieldwork experience to test survey materials. The participants worked in five teams that mirrored the team composition planned for the actual fieldwork (one supervisor, four interviewers, and one biomarker technician). The practice was carried out in five villages in Kompong Thom province. Twenty-four households in each village were selected for data collection, and the teams collected data from these households during the field practice. In total, 78 households, 58 women, and 61 men were interviewed.

1.6 TRAINING OF FIELD STAFF

1.6.1 Questionnaire Training

The main training for the 2021–22 CDHS was organized at the Ministry of Planning main auditorium in Phnom Penh. One hundred twenty-five candidates participated in the training, 100 interviewers and 25 team supervisors. All candidates participated in questionnaire training from July 19 to 31, 2021. Two NIS

coordinators and one ICF staff member conducted the questionnaire training. About half of the participants had worked on previous rounds of the CDHS or on other surveys, while the rest had no survey experience. Forty percent (50) of the participants were from provincial health departments, another 40% (50) were from provincial statistics departments, and 20% (25) were from NIS.

Mock interviews were organized at the end of training. Each trainee completed one Household Questionnaire and two individual questionnaires. The data collected during the practice exercises were later used in training sessions to test the CAPI programs and to practice collecting data on the tablets. Representatives from development partners and from various departments of the Ministry of Health and Ministry of Women's Affairs attended the training via Zoom. They participated in discussing topics related to child health and early childhood development, family planning and reproductive health, HIV/AIDS, nutrition, immunization, and domestic violence.

A significant challenge for the survey was that the training participants were selected by the MoH and NIS/Ministry of Planning from their provincial departments. Thus, most of the participants met expected qualifications, including experience in using computers and in working on a survey. As only the exact numbers of participants needed to form the planned teams were allowed to be trained, there were no backup interviewers.

1.6.2 Anthropometry Training

The anthropometry training was conducted by nutritionists from the MoH. Because of UNICEF's COVID-19 risk mitigation policy, UNICEF Cambodia could not participate. COVID-19 restrictions also prevented the women and children required for the anthropometry practice and standardization from coming into the NIS building. For the same reason, meetings and gatherings at community centers for anthropometry practice and standardization did not take place. Practice on measuring adults was done with interviewers and NIS staff volunteers.

1.6.3 CAPI Training

The CAPI training was done from August 2 to 21 with in-person and virtual technical assistants. The training took longer than usual because a COVID-19 incident happened within the information technology (IT) department at the end of the first week of training. Large gatherings were no longer permitted, and so participants were split into four small groups. Two groups were trained during the day, one from 8 a.m. to 12:30 p.m. and another from 1:30 p.m. to 5:30 p.m. Two days were required to present each remaining topic on the agenda. The CAPI system was translated into Khmer, including questions, response categories, error messages, reports, menus, and so on. The translations and checking were done by ICF and NIS staff. The Household, Woman's, Man's, and Biomarker questionnaires, as well as the interviewer and supervisor CAPI system, were also translated into Khmer.

The participants were grouped into 25 teams, each consisting of a team supervisor and four interviewers. Participants learned how to record responses in the CAPI system and how to use Bluetooth to exchange assignments and transfer questionnaire data and updates for the CAPI system. Supervisors also learned how to use an internet connection and the Internet File Streaming System (IFSS) to send data to the central office and to upload CAPI system updates into their tablets.

Because of COVID-19 regulations, field practice could not be implemented after the classroom training was completed. Instead, interviewers were asked to collect data at home and in their neighborhoods. This enabled participants to complete the training curriculum and gain experience on how to use the CAPI system for data collection and for closing a cluster. Clusters had been created for this improvised method—one cluster per team and each cluster with five households. Each team interviewer and team supervisor interviewed at least one household using the Household Questionnaire and all eligible adults who were the same gender as the interviewer using the appropriate individual questionnaire. Biomarker Questionnaires were also completed and keyed into the CAPI system. This kind of field practice would not

normally replace conventional field practice. Nonetheless, under the circumstances it was very helpful, and the training was successfully completed. The workaround ensured that one of the most important aspects of the training was accomplished.

1.7 FIELDWORK

Data collection was carried out by 25 field teams. Each team was provided a driver and a four-wheel-drive vehicle. Coordinators from the NIS and MoH coordinated and supervised fieldwork activities. ICF provided virtual technical assistance during the data collection period. The fieldwork began on September 15, 2021, in all 25 provinces, with each field team responsible for one province. The teams were closely monitored for quality control by the five field coordinators. There were instances when teams had to change their planned routing or to pause field activities due to COVID-19 outbreaks in their provinces. Data collection was completed on February 15, 2022.

Fieldwork monitoring was an integral part of the 2021–22 CDHS and was carried out during field data collection by the NIS, the MoH, and, virtually, ICF. NIS and MoH coordinators were equipped with monitoring guidelines. Every week the NIS and ICF generated field check tables from the completed interview data to monitor data quality and fieldwork progress. Feedback was regularly provided to the coordinators and the field teams.

1.8 DATA PROCESSING

The processing of the 2021–22 CDHS data began as soon as the fieldwork started. When data collection was completed in each cluster, the electronic data files were transferred via the IFSS to the NIS central office in Phnom Penh. The data files were registered and checked for inconsistencies, incompleteness, and outliers. Errors and inconsistencies were communicated to the field teams for review and correction. Secondary editing, done by NIS data processors, was carried out in the central office and included resolving inconsistencies and coding open-ended questions. The paper Biomarker Questionnaires were collected by field coordinators and then compared with the electronic data files to assess whether any inconsistencies arose during data entry. Data processing and editing were carried out using the CSPro software package. The concurrent data collection and processing offered an advantage because it maximized the likelihood of the data being error-free. Timely generation of field check tables allowed for effective monitoring. The secondary editing of the data was completed in March 2022.

Numbers in the tables throughout this report reflect weighted numbers. Percentages based on 25 to 49 unweighted cases are shown in parentheses, and percentages based on fewer than 25 unweighted cases are suppressed and replaced with an asterisk. This is to caution readers when interpreting data that a percentage based on fewer than 50 cases might not be statistically reliable.

1.9 RESPONSE RATES

Table 1.1 describes the 2021–22 CDHS sample and presents response rates. A total of 21,270 households were selected for the CDHS sample, of which 20,967 were found to be occupied. Of the occupied households, 20,806 were successfully interviewed, yielding a response rate of 99%. In the interviewed households, 19,845 women age 15–49 were identified as eligible for individual interviews. Interviews were completed with 19,496 women, yielding a response rate of 98%. In the subsample of households selected for the male survey, 9,079 men age 15–49 were identified as eligible for individual interviews and 8,825 were successfully interviewed, yielding a response rate of 97%.

Table 1.1 Results of the household and individual interviews

Number of households, number of interviews, and response rates, according to residence (unweighted), Cambodia DHS 2021–22

Result	Residence		
	Urban	Rural	Total
Household interviews			
Households selected	7,230	14,040	21,270
Households occupied	7,127	13,840	20,967
Households interviewed	7,059	13,747	20,806
Household response rate ¹	99.0	99.3	99.2
Interviews with women age 15–49			
Number of eligible women	7,163	12,682	19,845
Number of eligible women interviewed	7,033	12,463	19,496
Eligible women response rate ²	98.2	98.3	98.2
Household interviews in subsample			
Households selected	3,615	7,020	10,635
Households occupied	3,563	6,903	10,466
Households interviewed	3,531	6,856	10,387
Household response rate in subsample ¹	99.1	99.3	99.2
Interviews with men age 15–49			
Number of eligible men	3,237	5,842	9,079
Number of eligible men interviewed	3,166	5,659	8,825
Eligible men response rate ²	97.8	96.9	97.2

¹ Households interviewed/households occupied

² Respondents interviewed/eligible respondents

HOUSING CHARACTERISTICS AND HOUSEHOLD POPULATION

2

Key Findings

- **Cooking:** About half of Cambodian households (51%) use clean fuels and technologies for cooking.
- **Lighting:** Nearly all of households use clean fuels and technologies for lighting the house.
- **Household composition:** On average, households in Cambodia have 4.1 members, and 31% of households are female-headed.
- **Birth registration:** 92% of children under age 5 had their births registered with the civil authorities; this includes 87% with a birth certificate and 5% whose birth was registered but who do not have a birth certificate.
- **School attendance:** 74% of girls age 6–11 attend primary school, as compared with 72% of boys. The net attendance ratio (NAR) drops in secondary school: 45% of girls and 39% of boys age 12–18 attend secondary school.

Information on the socioeconomic characteristics of the household population in the 2021–22 CDHS provides a context for interpreting demographic and health indicators and furnishes an approximate indication of the representativeness of the survey. The information also sheds light on the living conditions of the population.

This chapter presents information on housing characteristics and household possessions, use of clean fuels and technologies (related to cooking and lighting), wealth, household population composition, children’s living arrangements and orphanhood, birth registration, educational attainment, and school attendance.

2.1 HOUSING CHARACTERISTICS

The 2021–22 CDHS collected data on access to electricity, flooring materials, and the number of rooms used for sleeping. Ninety-two percent of households in Cambodia have access to electricity (99% in urban areas and 88% in rural areas). The flooring materials most commonly used are wood/planks (40%) and ceramic tiles (19%). Usage of these materials varies widely by residence, with 51% of rural households using wood/planks and 33% of urban households using ceramic tiles (**Table 2.1**). In Cambodia, tobacco is smoked in the home daily in 29% of households (20% in urban areas and 35% in rural areas).

2.1.1 Use of Clean Fuels and Technologies

Primary reliance on clean fuels and technologies

The percentage of the population using clean fuels and technologies for cooking and lighting where each component is defined as follows:

Clean cooking fuels and technologies

Includes electric stove, solar cooker, liquefied petroleum gas (LPG)/natural gas stove, piped natural gas stove, and biogas stove.

Clean lighting fuels and technologies

Includes electricity, solar lantern, battery-powered or rechargeable flashlight/torch/lantern, and biogas lamp.

Sample: Households and de jure population

2.1.2 Cooking

Slightly more than half of Cambodian households (51%) use clean fuels and technologies for cooking (79% in urban areas and 34% in rural areas). The most commonly used clean fuel or technology is LPG/natural gas stove (47%). Nearly half of households (49%) cook with a three-stone stove or open fire (**Table 2.2**).

2.1.3 Lighting

Ninety-nine percent of households in Cambodia use clean fuels and technologies for lighting. Electricity is the most commonly used clean fuel and technology (91%) for lighting (**Table 2.3**). Ninety-eight percent of urban households light their home with electricity, as compared with only 87% of rural households.

2.1.4 Primary Reliance on Clean Fuels and Technologies

Fifty percent of the household population relies primarily on clean fuels and technologies for cooking and 50% relies primarily on solid fuels. The majority of the urban population (78%) relies primarily on clean fuels and technologies for cooking, while 67% of the rural population relies primarily on solid fuels (**Table 2.4**). Nearly the entire household population primarily relies on clean fuels and technologies for lighting. However, only 50% of the household population primarily relies on clean fuels and technologies for both cooking and lighting.

2.2 HOUSEHOLD WEALTH

2.2.1 Household Durable Goods

Table 2.5 shows information on ownership of various household effects, means of transportation, agricultural land, and livestock/farm animals. Urban households are generally more likely to own the listed household effects. For example, 60% of urban households own television sets, as compared with 47% of rural households. Also, 45% of urban households own a refrigerator, compared with 15% of rural households. However, rural households are more likely to own agricultural land (69%) and farm animals (66%) than urban households (31% and 29%, respectively). Nationally, the most common means of transportation are motorcycles/scooters (82% of households) and bicycles (54% of households).

2.2.2 Wealth Index

Wealth index

Households are given scores based on the number and kinds of consumer goods they own, ranging from a television to a bicycle or car, and housing characteristics such as source of drinking water, toilet facilities, and flooring materials. These scores are derived using principal component analysis. National wealth quintiles are compiled by assigning the household score to each usual (de jure) household member, ranking each person in the household population by her or his score, and then dividing the distribution into five equal categories, each comprising 20% of the population.

Sample: Households

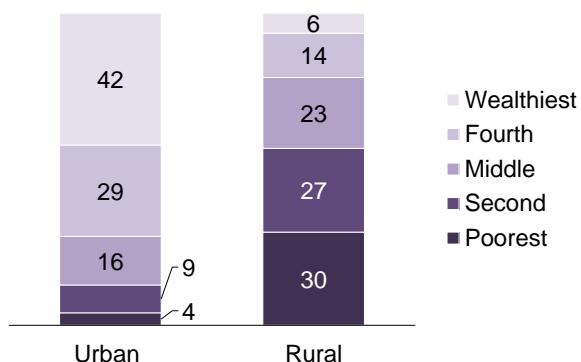

Table 2.6 presents wealth quintiles according to urban-rural residence and province. The table also includes the Gini coefficient, a measure of disparity in wealth. The Gini coefficient ranges from 0–1, with 0 implying an equal distribution of wealth and 1 implying a totally unequal distribution.

Figure 2.1 and **Table 2.6** show that 42% of the de jure population in urban areas is in the highest wealth quintile, as compared with 6% in rural areas. Fifty-seven percent of rural household members are in either the lowest (30%) or the second (27%) wealth quintile.

Ratanak Kiri has the highest percentage of the population in the lowest wealth quintile (75%). The percentage of the population in the highest wealth quintile is highest in Phnom Penh (68%) and Preah Sihanouk (32%) (**Table 2.6**).

Figure 2.1 Household wealth by residence

Percent distribution of de jure population by wealth quintile

2.3 HOUSEHOLD POPULATION AND COMPOSITION

Household

A person or group of related or unrelated persons who live together in the same dwelling unit(s), who acknowledge one adult male or female as the head of the household, who share the same housekeeping arrangements, and who are considered a single unit.

De facto population

All persons who stayed in the selected households the night before the interview (whether usual residents or visitors).

De jure population

All persons who are usual residents of the selected households, whether or not they stayed in the household the night before the interview.

How data are calculated

All tables are based on the de facto population unless otherwise specified.

The 2021–22 CDHS included a total of 82,998 individuals, of whom 39,662 were male and 43,336 were female. **Table 2.7** shows that 32% of the population is age 0–14, 61% is age 15–64, and only 7% is age 65 and older.

Figure 2.2 shows the de facto household population by 5-year age groups according to sex. This type of distribution is characteristic of developing countries in demographic transition, with declining birth and death rates.

Table 2.8 shows that 31% of

households in Cambodia are female-headed. Overall, the average

household has 4.1 usual members, and differences between urban and rural households are minor.

Seventeen percent of households in Cambodia include children who are orphans or who are not living with either biological parent.

Trends: The mean household size declined from 5.4 persons in 2000 to 4.1 in 2021–22.

2.4 CHILDREN'S LIVING ARRANGEMENTS AND PARENTAL SURVIVAL

Orphan

A child with one or both parents who are dead.

Sample: Children under age 18

Fourteen percent of children under age 18 are not living with a biological parent, and 7% are orphans. The percentage of children not living with a biological parent and the percentage of children with one or both parents dead increase with age; among children age 15–17, 16% do not live with a biological parent, and for 12% one or both parents are deceased (**Table 2.9**).

Trends: The percentage of children under age 18 who do not live with a biological parent increased from 8% in 2005 to 14% in 2021–22.

2.5 BIRTH REGISTRATION

Registered birth

Child has a birth certificate or child does not have a birth certificate, but the birth is registered with the civil authorities.

Sample: De jure children under age 5

The global concern regarding the need to have all births registered by 2030 is evident in targets 16.9.1 and 17.19.2 of the SDGs. This is important given the need to protect all children because a child who is not registered is in danger of being shut out of society—denied the right to an official identity, a recognized name, and a nationality.

Figure 2.2 Population pyramid

Percent distribution of the household population

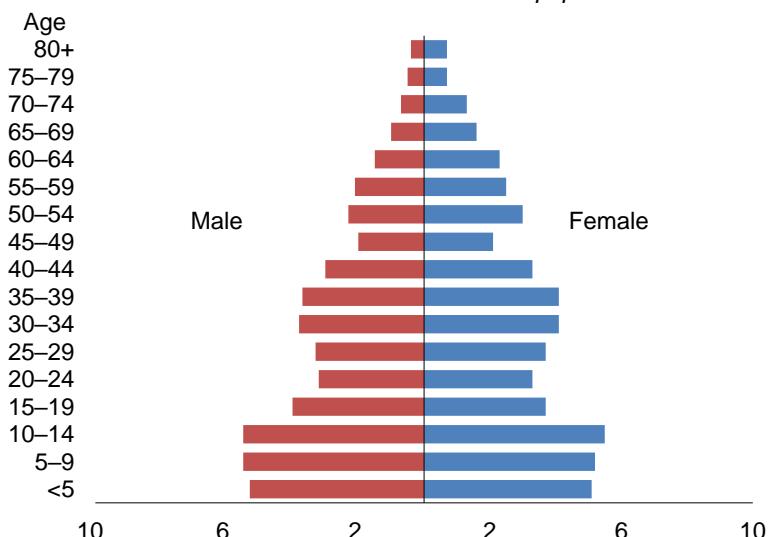

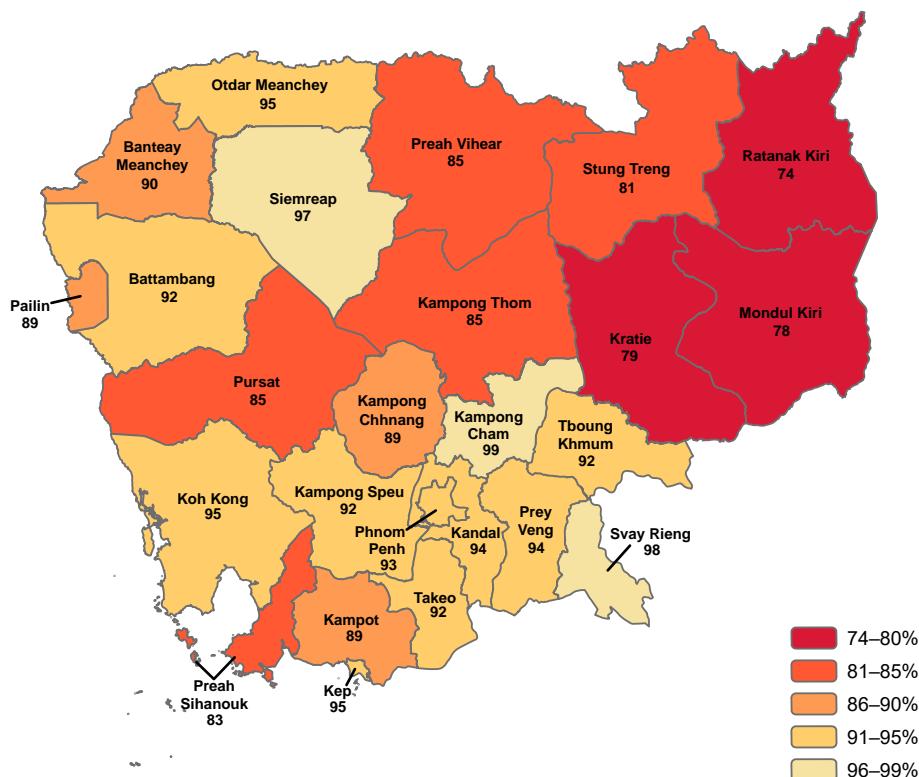

Table 2.10 presents information on birth registration of children under age 5. At the time of the survey, 92% of children's births were registered with the civil authorities; this includes 87% with a birth certificate and 5% whose birth was registered but who do not have a birth certificate.

Children under age 1 (85%) are less likely to have their birth registered than children age 1–4 (93%). The percentage of children whose birth is registered is slightly higher in urban areas (93%) than in rural areas (91%). There are large variations by province in the percentage of children under age 5 whose births are registered with the civil authorities, ranging from 74% in Ratanak Kiri to 99% in Kampong Cham (**Map 2.1**).

Map 2.1 Birth registration by province

Percentage of de jure children under age 5 whose births are registered with the civil authorities

Trends: The percentage of children under age 5 whose births are registered with the civil authorities increased from 66% in 2005 to 92% in 2021–2022.

2.6 EDUCATION

2.6.1 Educational Attainment

Median educational attainment

Half of the population has completed less than the median number of years of schooling, and half of the population has completed more than the median number of years of schooling.

Sample: De facto household population age 6 and older

Education is one of the most important aspects of social and economic development. **Tables 2.11.1** and **2.11.2** present information on educational attainment among the household population age 6 and over.

Overall, 20% of women and girls age 6 and over have never been to school, 40% have attended some primary school, 8% have completed primary school but advanced no further, 24% have attended some secondary school, 4% have completed secondary school but advanced no further, and 4% have attained some education after secondary school. Women and girls age 6 and over have completed a median of 3.8 years of schooling.

Educational attainment among men and boys is slightly higher than for women and girls. Thirteen percent of men and boys age 6 and over have never been to school, 38% have attended some primary school, 8% have completed primary school but advanced no further, 28% have attended some secondary school, 6% have completed secondary school but advanced no further, and 6% have attained some education after secondary school. Men and boys age 6 and over have completed a median of 4.8 years of schooling.

Trends: Median years of schooling among females increased from 1.1 years in 2000 to 3.8 years in 2021–22; over the same period, median years of schooling increased from 2.5 years to 4.8 years among males.

Patterns by background characteristics

- The median number of years of schooling is higher in urban areas than rural areas among both females (5.0 years versus 2.9 years) and males (6.3 years versus 4.0 years).
- Among both females and males, the median number of years of schooling increases with increasing wealth. For example, among females, the median number of years of schooling completed rises from 1.6 years in the lowest wealth quintile to 6.5 years in the highest quintile.

2.6.2 Primary and Secondary School Attendance

Net attendance ratio (NAR)

Percentage of the school-age population that attends primary or secondary school.

Sample: Children age 6–11 for primary school NAR and children age 12–18 for secondary school NAR

Gross attendance ratio (GAR)

The total number of children attending primary school divided by the official primary school-age population and the total number of children attending secondary school divided by the official secondary school-age population.

Sample: Children age 6–11 for primary school GAR and children age 12–18 for secondary school GAR

In Cambodia, the primary school net attendance ratio (NAR) for children age 6–11 is 73% (74% for girls and 72% for boys). The secondary school NAR for children age 12–18 drops to 42% (45% for girls and 39% for boys) (**Table 2.12**).

The primary school gross attendance ratio (GAR) for children age 6–11 is 93%, (93% for both girls and boys). The secondary school GAR for children age 12–18 is 48%, and the ratio is higher for girls than for boys (51% and 46%, respectively).

Gender parity index (GPI)

The ratio of female to male students attending primary school and the ratio of female to male students attending secondary school. The index reflects the magnitude of the gender gap.

Sample: Primary school students and secondary school students

A GPI of 1 indicates parity or equality between male and female school participation. The GPI for the GAR at the primary school level is 1.00, indicating that in primary school there are equal numbers of male and female students. However, at the secondary school level, the GPI for the GAR is 1.13, indicating that there are more girls than boys attending secondary school (**Table 2.12**).

Patterns by background characteristics

- The NAR and GAR vary by province. For example, the primary school NAR is lowest in Kampong Speu (34%) and highest in Kampong Chhnang (94%).
- The secondary school NAR and GAR both increase with increasing household wealth. In contrast, the primary school NAR and GAR do not have a clear relationship with household wealth.

2.6.3 Participation Rate in Organized Learning among Children Age 5

Participation rate in organized learning—adjusted net attendance ratio (NAR)

Percentage of children 1 year younger than the official primary school entry age (at the beginning of the school year) who are attending an early childhood education program or primary school. The ratio is termed adjusted since it includes children in primary school.

Sample: Children age 5 at the beginning of the school year

Fifty-six percent of children who were age 5 at the beginning of the school year participated in organized learning; 26% attended an early childhood education program, and 31% attended primary school (**Table 2.13**).

Patterns by background characteristics

- The adjusted NAR for children age 5 at the beginning of the school year is higher among girls (60%) than boys (53%).
- By province, the adjusted NAR is highest in Banteay Meanchey (77%) and lowest in Kampong Speu (13%).
- The children age 5 at the beginning of the school year in the lowest wealth quintile have the lowest adjusted NAR (48%) and those in the highest wealth quintile have the highest adjusted NAR (71%).

Table 2.8 Household composition

Percent distribution of households by sex of head of household and by household size, mean size of households, and percentage of households with orphans and children under age 18 not living with a biological parent, according to residence, Cambodia DHS 2021–22

Characteristic	Residence		
	Urban	Rural	Total
Household headship			
Male	68.1	69.5	68.9
Female	31.9	30.5	31.1
Total	100.0	100.0	100.0
Number of usual members			
1	5.9	5.2	5.5
2	15.9	12.2	13.6
3	18.0	18.3	18.2
4	23.5	25.9	25.0
5	18.0	18.8	18.5
6	9.3	10.7	10.2
7	4.3	5.2	4.9
8	2.7	2.0	2.3
9+	2.4	1.7	2.0
Total	100.0	100.0	100.0
Mean size of households	4.1	4.2	4.1
Percentage of households with children under age 18 who are orphans or not living with a biological parent			
Double orphans	1.6	2.1	1.9
Single orphans ¹	5.0	5.0	5.0
Children not living with a biological parent ²	9.5	15.3	13.0
Orphans and/or children not living with a biological parent	13.2	18.7	16.6
Number of households	8,066	12,740	20,806

Note: Table is based on de jure household members, i.e., usual residents.

¹ Includes children with one dead parent and an unknown survival status of the other parent

² Children not living with a biological parent are those under age 18 living in households with neither their mother nor their father present.

Table 2.9 Children's living arrangements and orphanhood

Percent distribution of de jure children under age 18 by living arrangements and survival status of parents, percentage of children not living with a biological parent, and percentage of children with one or both parents dead, according to background characteristics, Cambodia DHS 2021–22

Background characteristic	Living with mother but not with father		Living with father but not with mother		Not living with either parent					Percent-age not living with a biological parent	Percent-age with one or both parents dead ¹	Number of children	
	Living with both parents	Father alive	Father dead	Mother alive	Mother dead	Both alive	Only mother alive	Only father alive	Both dead	Missing information on father/mother

¹ The NAR for primary school is the percentage of the primary school-age (6–11 years) population that is attending primary school. The NAR for secondary school is the percentage of the secondary school-age (12–18 years) population that is attending secondary school. By definition, the NAR cannot exceed 100.0.

² The GAR for primary school is the total number of primary school students, expressed as a percentage of the official primary school-age population. The GAR for secondary school is the total number of secondary school students, expressed as a percentage of the official secondary school-age population. If there are significant numbers of overage and underage students at a given level of schooling, the GAR can exceed 100.0.

³ The gender parity index for primary school is the ratio of the primary school NAR (GAR) for females to the NAR (GAR) for males. The gender parity index for secondary school is the ratio of the secondary school NAR (GAR) for females to the NAR (GAR) for males.

Table 2.13 Participation rate in organized learning

Percent distribution of children 1 year younger than the official primary school entry age at the beginning of the school year by attendance at an early childhood education program or primary school, and the adjusted net attendance ratio (NAR), according to background characteristics, Cambodia DHS 2021–22

¹ Percentage of children 1 year younger than the official primary school entry age (at the beginning of the school year) who are attending early childhood education or primary school.

CHARACTERISTICS OF RESPONDENTS

Key Findings

- **Literacy:** The percentage of respondents who are literate has increased since 2014, from 76% to 81% among women and from 84% to 86% among men. Over the same period, the median number of years of schooling completed has increased from 4.8 to 6.0 years among women and from 6.0 to 6.7 years among men.
- **Internet usage:** 64% of women and 77% of men reported that they had ever used the internet.
- **Employment:** 66% of women and 87% of men are currently employed.
- **Occupation:** The proportion of respondents working in agricultural occupations has declined since 2014, from 44% to 21% among women and from 51% to 28% among men. In contrast, the proportion who are engaged in skilled manual labor has increased from 26% to 37% among men and from 22% to 27% among women.

This chapter presents information on the demographic and socioeconomic characteristics of the survey respondents such as age, education, literacy, marital status, employment, occupation, wealth, health insurance coverage, residence at birth, current place of residence, and recent migration. The chapter also presents information on respondents' use of alcohol and tobacco. Together, this information is useful for understanding the factors that affect use of reproductive health services, contraceptive use, and other health behaviors.

3.1 BASIC CHARACTERISTICS OF SURVEY RESPONDENTS

The 2021–22 CDHS interviewed 19,496 women and 8,825 men age 15–49. **Table 3.1** shows the percent distribution of women and men age 15–49 by background characteristics. Forty-four percent of women and 46% of men are under age 30.

Nearly all Cambodians are Buddhist (97% each of women and men). Three percent of respondents identify as Muslim or Christian or do not practice any religion.

Women are more likely than men to be currently married or living together with a partner (69% and 62%, respectively). Women are less likely than men to have never been married (25% and 35%, respectively).

About three in five Cambodians live in rural areas (58% of women and 57% of men).

3.2 EDUCATION AND LITERACY

Literacy

Respondents who have attended higher than secondary school are assumed to be literate. All other respondents were considered literate if they could read aloud all or part of a sentence shown to them.

Sample: Women and men age 15–49

Education is one of the most important determinants of an individual's knowledge and behavior. **Table 3.2.1**, **Table 3.2.2**, and **Figure 3.1** show levels of education among women and men. Women are twice as likely as men to have no formal education (12% versus 6%), while half of women (50%) and 58% of men have some secondary education or higher.

Eighty-one percent of women and 86% of men are literate (**Tables 3.3.1** and **3.3.2**).

Trends: The percentage of respondents who are literate has increased since 2014, from 76% to 81% among women and from 84% to 86% among men. The percentage of women and men with no education has remained basically unchanged over the same period. The median number of years of schooling completed has increased from 4.8 to 6.0 years among women and from 6.0 to 6.7 years among men.

Patterns by background characteristics

- Urban women are better educated than rural women; only 7% of urban women have no education, as opposed to 15% of rural women (**Table 3.2.1**).
- Educational attainment among women increases with increasing household wealth (**Figure 3.2**). For example, only 2% of women in the lowest wealth quintile have a secondary education or higher, as compared with 33% of those in the highest quintile. A similar pattern is observed among men.

Figure 3.1 Education of survey respondents

Percent distribution of women and men age 15–49 by highest level of schooling attended or completed

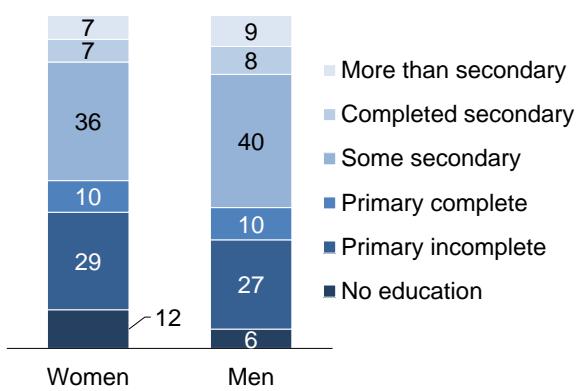

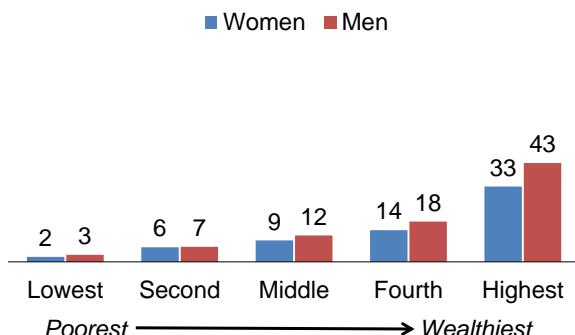

Figure 3.2 Secondary education by household wealth

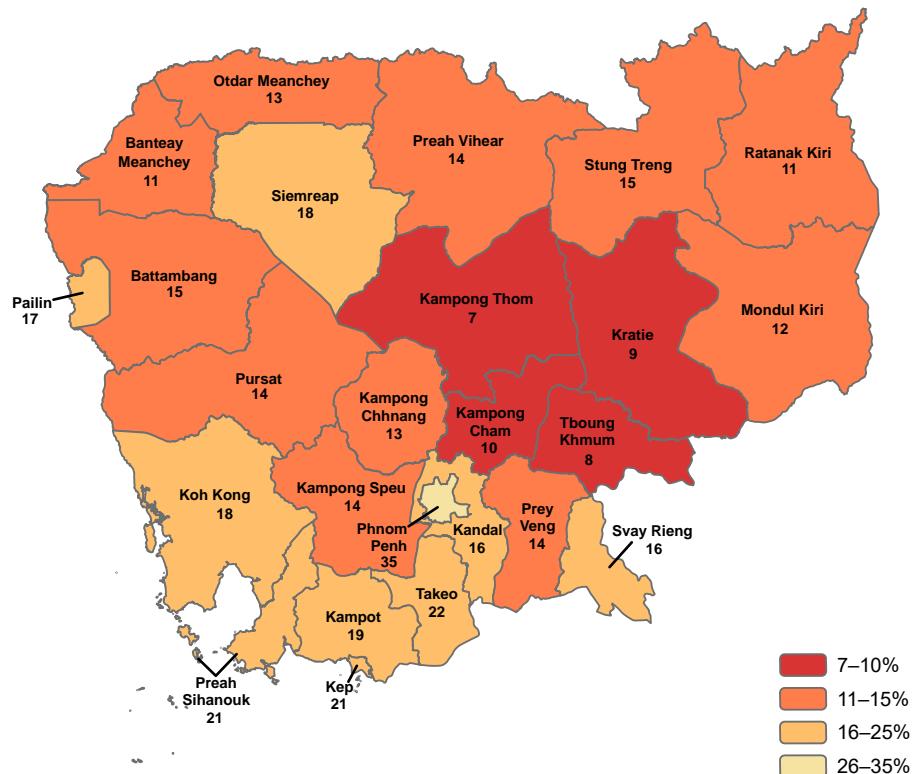

Percentage of women and men age 15–49 with secondary education complete or higher

- The percentage of women who have completed secondary education or higher is highest in Phnom Penh (26%) and lowest in Kampong Thom and Ratanak Kiri (7% each) (**Map 3.1**).

Map 3.1 Secondary education by province

Percentage of women and men age 15–49 with secondary education complete or higher

- The median number of years of education completed is higher among urban residents than rural residents. Urban women have completed a median of 7.0 years of education, while the median among rural women is 5.2 years. The corresponding figures among men are 8.0 years and 5.9 years.
- Women and men in the lowest wealth quintile (60% and 71%, respectively) are less likely than other women and men to be literate (**Table 3.3.1** and **Table 3.3.2**).

3.3 MASS MEDIA EXPOSURE AND INTERNET USAGE

Exposure to mass media

Respondents were asked how often they read a newspaper, listened to the radio, or watched television. Those who responded *at least once a week* are considered regularly exposed to that form of media.

Sample: Women and men age 15–49

Use of the internet

Respondents were asked if they have ever used the internet from any device, if they used the internet in the last 12 months, and, if so, how often they have used it during the last month.

Sample: Women and men age 15–49

Exposure to different mass media is key to information dissemination and expansion of knowledge. **Tables 3.4.1** and **3.4.2** show the percentages of women and men who are exposed to different types of media, by background characteristics. The level of exposure to mass media is generally low in Cambodia. Among both women and men, television is the most frequently accessed form of media: 22% of women and 30% of men watch television at least once a week. Eight percent of women read newspapers and 5% listen to the radio at least once a week. The corresponding percentages among men are 23% and 12%.

Figure 3.3 shows that 72% of female respondents and 57% of male respondents have no access to any of the three media sources at least once a week.

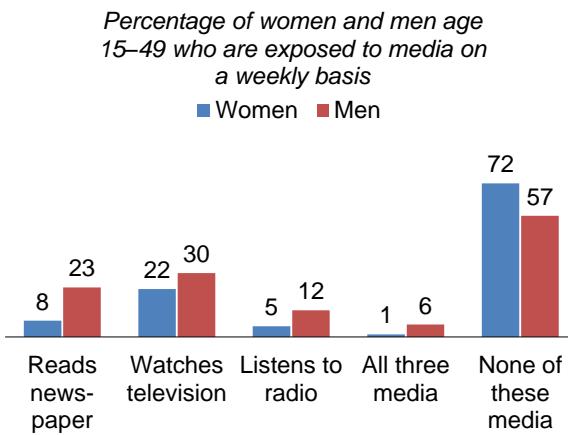

The internet has gradually become an important means of transacting business, sharing information, and interacting through social media, and a number of organizations have adopted it as a way to reach people. There are currently online shopping platforms through which business is transacted on a daily basis in Cambodia. Also, some e-health platforms have started operating in the country, particularly during the COVID-19 pandemic. Overall, 64% of women and 77% of men age 15–49 reported that they had ever used the internet, and practically all of those reported using the internet in the past 12 months (**Tables 3.5.1** and **3.5.2**).

Trends: Women's and men's exposure to mass media has declined since 2014. For example, the proportion of women who listen to the radio at least once a week has dropped from 32% to 5%. This proportion has also dropped among men, from 45% to 12%. The proportion of respondents having no access to any of the three sources (newspaper, television, and radio) has increased from 31% to 72% among women and from 25% to 57% among men.

Patterns by background characteristics

- While the percentage of women who read a newspaper at least once a week is very low, urban women are over two times more likely to read a newspaper than rural women (11% and 5%, respectively). The urban-rural gap is less evident in television viewing and radio listening.
- The percentages of women and men with no access to any of the three media sources are lowest in Preah Sihanouk (43% and 14%, respectively) and among those in the highest wealth quintile (64% and 29%, respectively). Women and men with no formal education are most likely to have no access to any of the three media (84% and 82%, respectively).
- Urban women and men (73% and 88%, respectively) are more likely than rural women and men (58% and 69%, respectively) to have ever used the internet.
- The proportion of women and men who have ever used the internet increases substantially by wealth quintile. Less than half (41%) of women and 56% of men in the lowest wealth quintile have ever used the internet, as compared with 79% of women and 95% of men in the highest wealth quintile.
- The proportion of women and men who have ever used the internet also increases with increasing education.

Figure 3.3 Exposure to mass media

3.4 EMPLOYMENT

Currently employed

Respondents who were employed in the 7 days before the survey.

Sample: Women and men age 15–49

In the 2021–22 CDHS, respondents were asked whether they were employed at the time of the survey and, if not, whether they had worked at any time during the 12 months preceding the survey. **Tables 3.6.1** and **3.6.2** show that 66% of women and 87% of men are currently employed. Furthermore, 9% of women and 4% of men reported that they had worked in the past 12 months but were not currently employed.

Trends: Current employment among women age 15–49 declined between 2014 and 2021–22, from 71% to 66%. However, the percentage of currently employed men changed only slightly (88% and 87%, respectively).

Patterns by background characteristics

- Divorced, separated, or widowed women (80%) are more likely to be employed than women who are currently married or living together with a partner (69%) and those who have never been married (55%) (**Table 3.6.1**). Among men, those who are currently married or living with a partner (97%) and those who are divorced, separated, or widowed (89%) are more likely to be employed than those who have never been married (68%) (**Table 3.6.2**).
- Urban women (75%) are more likely to be currently employed than rural women (60%). The urban-rural difference among men is not significant.
- The percentage of women who are currently employed increases with an increasing level of household wealth. However, this relationship is not observed in men.
- The percentage of women and men who are currently employed does not have a linear relationship with education.

3.5 OCCUPATION

Occupation

Categorized as professional/technical/managerial, clerical, sales and services, skilled manual, unskilled manual, domestic service, agriculture, and other.

Sample: Women and men age 15–49 who were currently employed or had worked in the 12 months before the survey

Tables 3.7.1 and **3.7.2** show that only small proportions of men and women were employed in professional/technical/managerial occupations in the 12 months before the survey (7% each). The two most frequently reported occupations among Cambodian women are sales and services and skilled manual work (33% and 27%, respectively). Among men, the top two occupations reported are skilled manual and agricultural work (37% and 28%, respectively). A lower percentage of women (21%) than men (28%) are engaged in agricultural work (**Figure 3.4**).

The large majority of employed women in Cambodia are paid for their work in cash (84%). Women engaged in agricultural work are much more likely (15%) than those working in nonagricultural occupations (2%) to not be paid for their work. Forty-nine percent of women who worked in the past year are self-employed, and another 45% worked for a non-family member (**Table 3.8**).

Trends: There has been a substantial decline since 2014 in the proportion of women working in agricultural occupations, from 44% to 21%. Among men, the proportion has decreased from 51% to 28%. In contrast, the proportion of respondents who are engaged in skilled manual labor has increased from 26% to 37% among men and from 22% to 27% among women.

Patterns by background characteristics

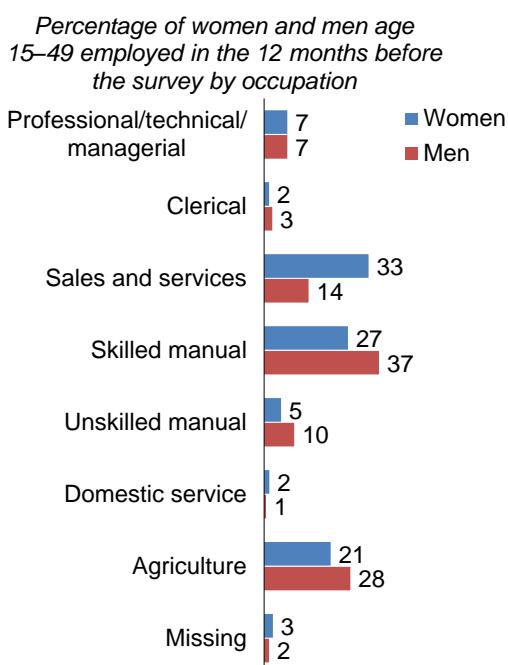

- Women and men living in rural areas are more likely to be engaged in agricultural work (34% and 41%, respectively) than those living in urban areas (5% and 9%, respectively) (**Tables 3.7.1** and **3.7.2**).
- Women and men with more than a secondary education are more likely than those at other educational levels to be engaged in professional/technical/managerial work (56% and 49%, respectively). The percentages of men and women employed in professional/technical/managerial and clerical occupations generally increase with increasing wealth.
- Women and men with no education are mostly engaged in the agriculture sector (41% and 52%, respectively).

3.6 HEALTH INSURANCE COVERAGE

The 2021–22 CDHS collected information about specific types of insurance coverage and the percentages of women and men with any health insurance. More than one in five women (22%) and 13% of men age 15–49 have health insurance. Social security health insurance is the most popular type of insurance among both women and men (16% and 10%, respectively) (**Table 3.9.1** and **Table 3.9.2**).

Trends: The percentage of women who have any form of health insurance has increased since 2014, from 16% to 22%. Health insurance coverage among men has not changed.

Figure 3.4 Occupation

3.7 TOBACCO USE

Table 3.10.1 shows that cigarette smoking and use of any type of tobacco are rare among Cambodian women (2%). Twenty-one percent of men smoke cigarettes and 2% use other type of tobacco. Nearly all men who smoke cigarettes also use other types of tobacco. Most of them (19%) smoke daily and 3% smoke occasionally (**Table 3.10.2**). Among men who smoke cigarettes daily, 29% smoke less than five cigarettes each day, while 15% smoke five to nine cigarettes, 22% smoke 10–14 cigarettes, and 30% smoke 15–24 cigarettes each day. Five percent of men who smoke cigarettes smoke 25 or more cigarettes daily (**Table 3.11**). Less than 1% of women and men use smokeless tobacco (**Table 3.12**).

Trends: Tobacco use among women is uncommon in Cambodia; since 2014, the percentage of women who report that they smoke has remained unchanged (2%), while the percentage of women who use other types of tobacco has dropped from 4% to less than 1%. The proportion of men who report that they smoke has decreased from 32% to 21%.

Patterns by background characteristics

- The percentage of women who use any type of tobacco increases from less than 1% among those age 15–19 to 6% among those age 45–49. The corresponding percentages among men are 8% and 40% (**Table 3.13**).
- The percentage of women and men who use tobacco is higher in Ratanak Kiri (22% and 39%, respectively) and Stung Treng (13% and 41%, respectively) than in other provinces.
- The percentage of women who use tobacco declines with increasing education, from 8% among those with no formal education to less than 1% among those with more than a secondary education. The corresponding percentages among men are 51% and 2%.
- Similarly, the percentage of women and men who use tobacco declines rapidly with increasing wealth quintile.

3.8 ALCOHOL CONSUMPTION

Almost 7 in 10 men (69%) and 16% of women consumed alcoholic beverages in the month prior to the survey. The majority of women who consumed alcoholic beverages (85%) did so only 1–5 days during the preceding month. Men drink more frequently than women; 10% of men drink every day or almost every day, 60% drink 1–5 days per month, 18% drink 6–10 days per month, and 12% drink between 11 and 24 days per month (**Table 3.14.1** and **Table 3.14.2**).

Among women who consumed alcohol during the preceding month, 80% consumed only one drink on days when alcohol was consumed, whereas 12% consumed two drinks. Twenty percent of men consumed at least four drinks on days when alcohol was consumed, 24% consumed two to three drinks, and 56% consumed only one drink (**Table 3.15.1** and **Table 3.15.2**).

Patterns by background characteristics

- Alcohol consumption among women is less common in Koh Kong (3%) than in Svay Rieng (34%) and Stung Treng (26%). Alcohol consumption among men is generally high in all provinces, ranging from 64% in Kampong Cham, Prey Veng, and Stung Treng to 80% in Mondul Kiri and Preah Vihear.
- The proportion of women who consume alcohol is higher in urban areas than in rural areas (18% versus 15%). There is no urban-rural difference in alcohol consumption among men.
- Alcohol consumption does not have a linear association with education or household wealth.

3.9 RESIDENCE AT BIRTH AND RECENT MIGRATION

Recent migration

Percentage of respondents who were born outside of their current place of residence and moved to their current place of residence in the 5 years preceding the survey.

Sample: Women and men age 15–49 who were born outside their current place of residence

Twenty-five percent of women and 36% of men were not born at their current place of residence. Among these respondents, 34% of women and 40% of men moved to the current place of residence in the 5 years prior to the survey. Less than 1% of women and men were born outside of Cambodia (**Table 3.16.1** and **Table 3.16.2**).

Patterns by background characteristics

- The percentage of women and men who were born outside of their current place of residence and move there in the 5 years before the survey is higher in urban areas (38% and 48%, respectively) than in rural areas (27% and 30%, respectively).
- Women and men with no formal education (25% and 24%, respectively) are less likely to have moved to their current place of residence during the last 5 years than other women and men.

3.9.1 Type of Migration

Most women and men who moved to their current place of residence in the 5 years before the survey moved from an urban area to another urban area (40% and 48%, respectively). The next most common types of migration are rural to urban among women (29%) and rural to rural among men (23%) (**Table 3.17**).

3.9.2 Reason for Migration

The most common reason for migration among women and men is employment (35% and 37%, respectively) (**Table 3.18.1** and **Table 3.18.2**). Migration for employment is substantially higher among urban women than their rural counterparts (48% versus 15%). A similar difference is observed among men.

MARRIAGE AND SEXUAL ACTIVITY

Key Findings

- **Current marital status:** 69% of women and 62% of men age 15–49 are currently married or living together with their partner as if married.
- **Median age at first marriage:** The median age at first marriage among women age 25–49 is 21.5 years, an increase from 20.5 years in 2014.
- **Age at first sexual intercourse:** 16% of women age 25–49 had their first sexual intercourse by age 18, as compared with 7% of men.
- **Median age at first sexual intercourse:** The median age at first sexual intercourse is 21.4 years among women age 25–49 and 22.7 years among men age 25–49.

Marriage and sexual activity help determine the extent to which women are exposed to the risk of pregnancy. Thus, they are important determinants of fertility levels. However, the timing and circumstances of marriage and sexual activity also have profound consequences for women's and men's lives.

4.1 MARITAL STATUS

Currently in union

Women and men who report being married or living together with a partner as though married at the time of the survey. In this report, the terms currently in union and currently married are used interchangeably except where noted.

Sample: Women and men age 15–49

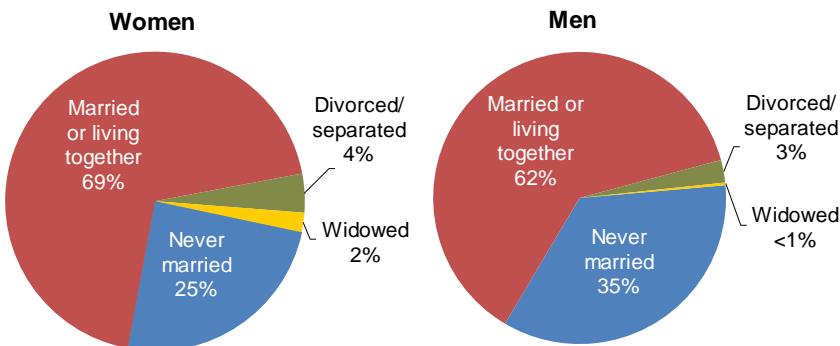

Sixty-nine percent of women and 62% of men are currently married or living together with a partner. By age 45–49, only 5% of women and less than 1% of men have not been married (**Table 4.1** and **Figure 4.1**).

Overall, women are more likely than men to be divorced, separated, or widowed (6% versus 3%).

Women are less likely to be single; 25% of women and 35% of men have never been married.

Figure 4.1 Marital status

Percent distribution of women and men age 15–49

Trends: The percentage of women currently in union changed only minimally between 2014 and 2021–22 (68% and 69%, respectively). The percentage of men currently in union decreased over this period, from 66% to 62%.

4.2 MARRIAGE REGISTRATION

Registered marriage

A woman whose marriage is registered with the civil authorities regardless of whether she has a marriage certificate.

Sample: Currently married women age 15–49; does not include women who are living together with a man as if married but do not report themselves to be married

Seventy-five percent of women who are married have registered with the civil authorities; however, only 51% have a marriage certificate (**Table 4.2**).

4.3 AGE AT FIRST MARRIAGE

Median age at first marriage

Age by which half of respondents have been married.

Sample: Women and men age 20–49, 25–49 and 30–49

Median ages at first marriage are 21.5 years among women age 25–49 and 24.4 years among men age 25–49 (**Figure 4.2**). These findings corroborate the fact that women tend to marry earlier than men. Nineteen percent of women age 25–49 and only 6% of men age 25–49 marry before their 18th birthday (**Table 4.3**).

Trends: The median age at first marriage among women age 25–49 has increased by 1 year since 2014, from 20.5 years to 21.5 years, while the median age among men has increased from 23.0 years to 24.4 years. The percentage of respondents who were married before age 18 has declined from 25% to 19% among women and from 9% to 6% among men.

Patterns by background characteristics

- Rural women age 25–49 marry at a younger age than their urban counterparts (20.9 years versus 22.3 years) (**Table 4.4** and **Figure 4.3**).
- Women in Ratanak Kiri marry at a much earlier age (18.8 years) than women in Phnom Penh (23.0 years) (**Table 4.4**).
- Women in the lowest wealth quintile marry almost 2 years earlier than women in the highest quintile (20.7 years versus 22.5 years) (**Table 4.4**).

Figure 4.2 Median age at first sex and first marriage

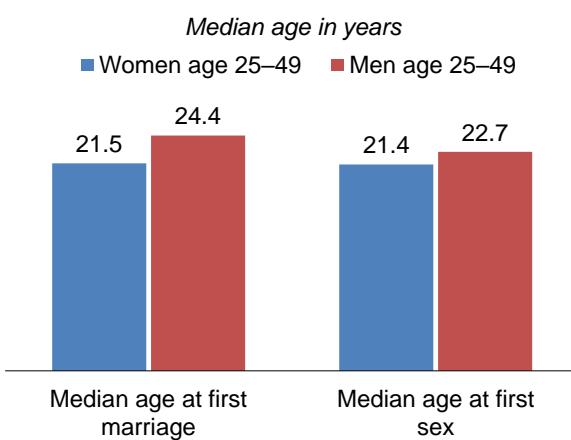

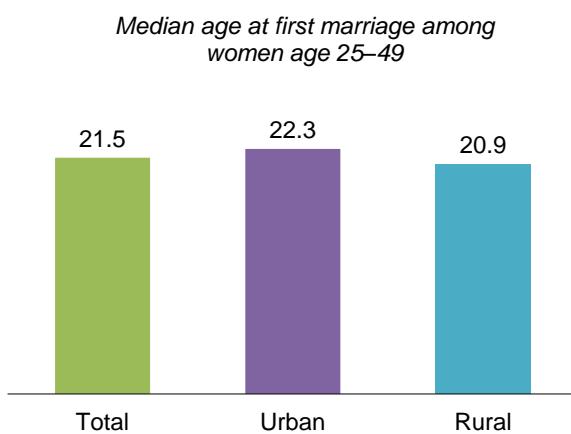

Figure 4.3 Women's median age at marriage by residence

4.4 AGE AT FIRST SEXUAL INTERCOURSE

Median age at first sexual intercourse

Age by which half of respondents have had sexual intercourse.

Sample: Women and men age 20–49, 25–49 and 15–24

The median age at first sexual intercourse among women age 25–49 in Cambodia is 21.4 years, while the median age among men age 25–49 is 22.7 years. On average, women initiate sexual intercourse 1.3 years earlier than men (**Table 4.5** and **Figure 4.2** on the preceding page).

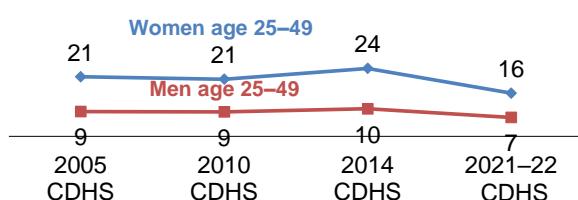

The median age at first sexual intercourse is 1.7 years earlier than the median age at first marriage among men age 25–49, while the difference in the median age at first sexual intercourse and the median age at first marriage among women 25–49 is not significant. This suggests that, in general, men have sexual intercourse before getting married and women have their first sexual intercourse when they get married (**Figure 4.2**).

One percent of women age 25–49 initiate sexual intercourse by age 15 and 16% by age 18. By age 22, more than half (55%) of women have had sexual intercourse. Less than 1% of men age 25–49 have their first sexual intercourse by age 15, 7% have intercourse by age 18, and 23% have intercourse by age 20 (**Table 4.5**).

Trends: The percentage of women age 25–49 who have had sexual intercourse by age 18 has dropped substantially since 2010, from 24% to 16%. Among men, the percentage has decreased from 10% to 7% (**Figure 4.4**). The median age at first sexual intercourse has increased from 20.7 to 21.4 years among women and from 22.0 to 22.7 years among men.

Figure 4.4 Trends in early sexual intercourse

Percentage who had first sexual intercourse by age 18

Patterns by background characteristics

- There are differences by residence in median age at first sexual intercourse among women. Rural women age 25–49 initiate sexual intercourse 1.3 years earlier than urban women. In contrast, there is a minimal difference by residence among men; rural men initiate sexual intercourse 0.3 years earlier than their urban counterparts (**Table 4.6**).
- By province, median age at first sexual intercourse is lowest among women in Ratanak Kiri (18.2 years) and highest among women in Phnom Penh (22.6 years).
- Women with no education engage in sexual intercourse earlier than women with a secondary education (20.2 years versus 21.8 years). The same pattern is observed among men.
- Women and men in the lowest wealth quintile initiate sexual intercourse earlier (20.5 years and 22.1 years, respectively) than women and men in the highest quintile (22.5 years and 23.5 years, respectively).

4.5 RECENT SEXUAL ACTIVITY

The survey collected data on recent sexual activity. Overall, slightly more than half of women and men age 15–49 (54% and 51%, respectively) reported having sexual intercourse during the 4 weeks before the survey. Twenty-four percent of women and 29% of men reported that they have never had sexual intercourse. For more information on recent sexual activity, see **Tables 4.7.1** and **4.7.2**.

¹ Excludes men who had sexual intercourse within the last 4 weeks

² Excludes men who are not currently married

Key Findings

- **Total fertility rate:** The total fertility rate for the 3 years preceding the survey is 2.7 children per woman (2.4 in urban areas and 3.0 in rural areas).
- **Fertility patterns:** Fertility decreases with increasing education and wealth.
- **Age at first birth:** The median age at first birth among women age 25–49 is 23.3 years. This means that half of women age 25–49 give birth for the first time before this age.
- **Birth intervals:** The median birth interval in Cambodia is 54.1 months. Only 11% of non-first births occur within 2 years after the preceding birth, 16% occur 24–35 months after the previous birth, and another 16% occur 36–47 months after the previous birth.
- **Teenage pregnancy:** 9% of women age 15–19 have ever been pregnant.

The number of children that a woman bears depends on many factors, including the age she begins childbearing, how long she waits between births, and her fecundity. Postponing first births and extending the interval between births have played a role in reducing fertility levels in many countries. These factors also have positive health consequences. In contrast, short birth intervals (of less than 24 months) can lead to harmful outcomes for both newborns and their mothers, such as preterm birth, low birth weight, and death. Childbearing at a very young age is associated with an increased risk of complications during pregnancy and childbirth and higher rates of neonatal mortality.

This chapter describes the current level of fertility in Cambodia and some of its proximate determinants. It presents information on the total fertility rate, birth intervals, insusceptibility to pregnancy (due to postpartum amenorrhea, postpartum abstinence, or menopause), age at first birth, teenage pregnancy, and induced abortion rates.

5.1 CURRENT FERTILITY

Total fertility rate

The average number of children a woman would have by the end of her childbearing years if she bore children at the current age-specific fertility rates. Age-specific fertility rates are calculated for the 3 years before the survey, based on detailed pregnancy histories provided by women.

Sample: Women age 15–49

The total fertility rate (TFR) in Cambodia is 2.7 children per woman. The age-specific fertility rate in the 15–19 age group is 48 births per 1,000 women; the rate peaks in the 20–24 age group (154 births per 1,000 women) and drops thereafter, to only 3 births per 1,000 women in the 45–49 age group (**Figure 5.1**). Age-specific fertility rates are generally lower among urban women than their rural counterparts. On average, rural women have 0.6 more children than urban women (3.0 children versus 2.4 children) (**Table 5.1** and **Figure 5.2**).

Trends: The overall fertility rate declined from 3.8 births per woman in 2000 to 2.7 births in 2014 and remained unchanged in 2021–22 (**Figure 5.3**). The apparent changes in urban and rural fertility rates between 2014 and 2021–22 are due to reclassification of about 20% of rural enumeration areas (EAs) to urban EAs in the 2019 General Population Census. In the last three CDHS surveys (2010, 2014, and 2021–22), the age-specific fertility rate has been highest among women age 20–24.

Table 5.3.1 shows age-specific fertility rates (ASFRs) for successive 5-year periods preceding the 2021–22 CDHS. Among women age 20–24, the ASFR declined from 151 per 1,000 15–19 years before the survey to 142 per 1,000 5–9 years before the survey and then slightly increased to 147 per 1,000 during the most recent period (0–4 years before the survey). Similarly, among women age 25–29, ASFRs declined from 164 per 1,000 15–19 years before the survey to 142 per 1,000 5–9 years before the survey before increasing slightly to 147 per 1,000 during the 0–4 years before the survey. This indicates that the fertility rate has stopped declining in recent years.

Figure 5.1 Trends in age-specific fertility

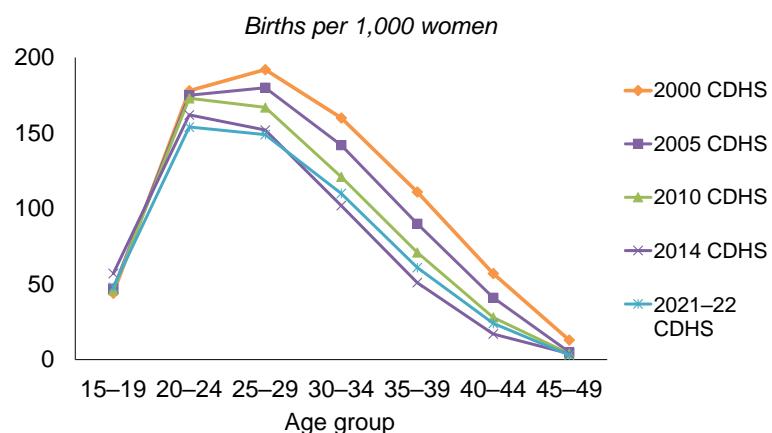

Figure 5.2 Fertility by residence

TFR for the 3 years before the survey

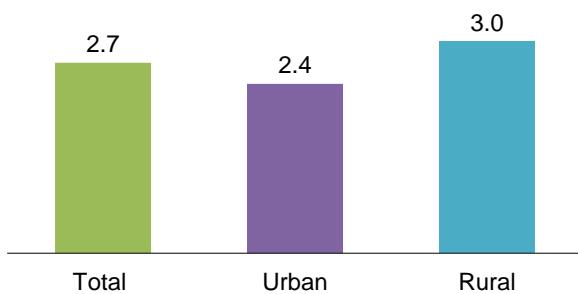

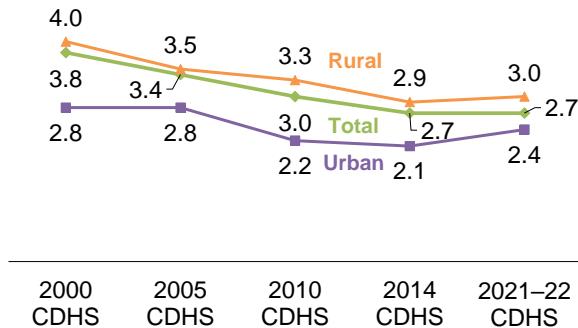

Figure 5.3 Trends in fertility by residence

TFR for the 3 years before each survey

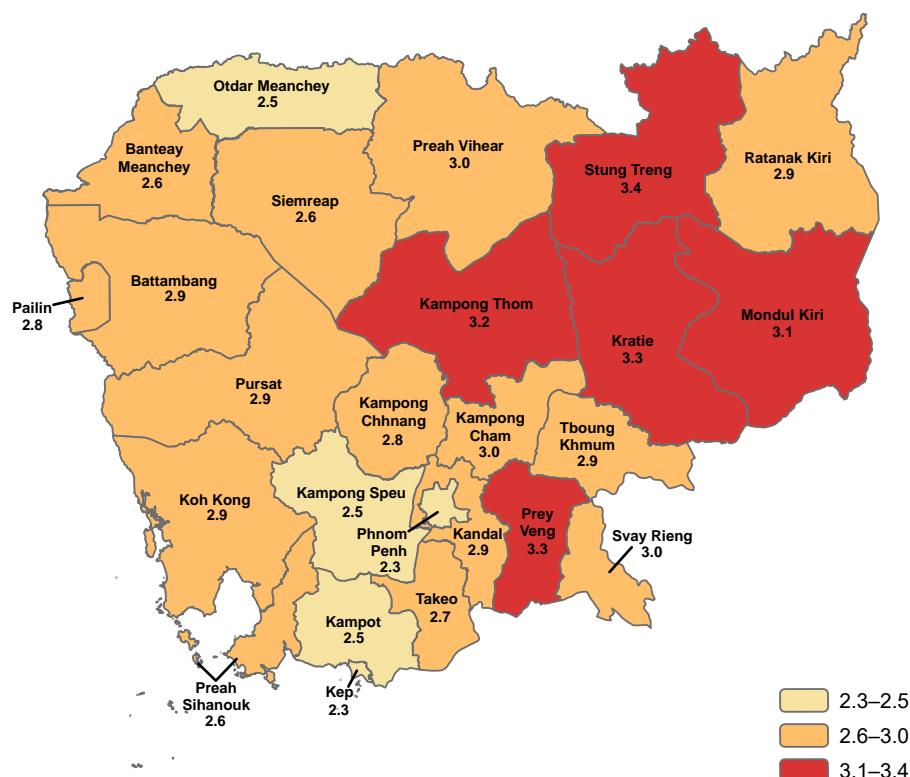

Patterns by background characteristics

- By province, the TFR is highest in Stung Treng (3.4 children) and lowest in Kep and Phnom Penh (2.3 children each) (**Map 5.1**).
- The TFR declines with increasing education, from 3.4 children among women with no formal education to 2.4 children among those with more than a secondary education (**Table 5.2**).

Map 5.1 Fertility by province

Total fertility rate for the 3 years before the survey

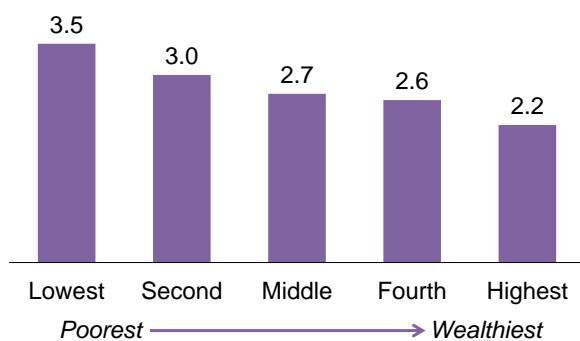

- The TFR also declines with increasing household wealth. The TFR is 3.5 children among women in the lowest wealth quintile and 2.2 children among those in the highest wealth quintile (**Table 5.2** and **Figure 5.4**).

5.2 CHILDREN EVER BORN AND LIVING

The 2021–22 CDHS also collected information on the number of children ever born to women age 15–49 and those still surviving by the time of the survey. Women have a mean of 1.68 children overall and a mean of 1.62 surviving children (a difference of 0.06). Among married women, the corresponding numbers are 2.26 children and 2.17 children (a difference of 0.09). On average, women age 45–49 have given birth to 3.14 children, of whom 2.91 survived to the time of the survey (**Table 5.4**). Of the 3.39 children on average born to currently married women age 45–49, 3.13 survived to the time of the survey. In Cambodia, 3% of currently married women

Figure 5.4 Fertility by household wealth

TFR for the 3 years before the survey

age 45–49 have never given birth. Since voluntary childlessness is rare, this is often viewed as a measure of primary sterility (**Table 5.4**).

5.3 BIRTH INTERVALS

Median birth interval

Number of months since the preceding birth by which half of children are born.

Sample: Non-first births in the 5 years before the survey

Short birth intervals, particularly those less than 24 months, place newborns and their mothers at increased health risk. The median birth interval in Cambodia is 54.1 months (**Table 5.5**). Only 11% of non-first births occur within 2 years after the preceding birth. Sixteen percent of births occur 24–35 months after the previous birth, and another 16% occur 36–47 months after the previous birth (**Figure 5.5**).

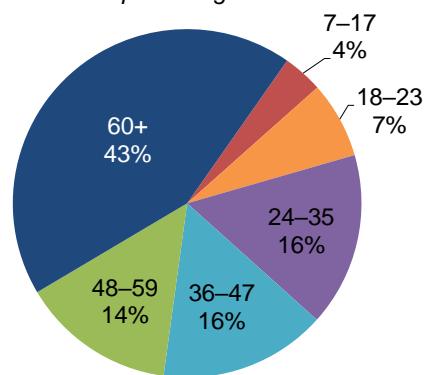

Trends: Median birth intervals have increased over time, from 34.1 months in 2000 and 36.8 months in 2005 to 40.0 months in 2010, 43.8 months in 2014, and 54.1 months in 2021–22.

Patterns by background characteristics

- By province, the median birth interval is shortest in Kampong Chhnang (46.9 months) and longest in Kampong Speu (61.6 months) (**Table 5.5**).
- The median birth interval is 24 months longer if the child from the preceding birth is living than if the child has died. In contrast, there is little difference in the median birth interval by sex of the preceding child (**Table 5.5**).
- The median birth interval increases with decreasing mother's education (**Table 5.5**).

Figure 5.5 Birth intervals

Percent distribution of non-first births by number of months since the preceding birth

5.4 INSUSCEPTIBILITY TO PREGNANCY

Postpartum amenorrhea

The period of time after the end of a pregnancy and before the resumption of menstruation.

Postpartum abstinence

The period of time after the end of a pregnancy and before the resumption of sexual intercourse.

Postpartum insusceptibility

The period of time during which a woman is considered not at risk of pregnancy because she is postpartum amenorrheic and/or abstaining from sexual intercourse postpartum.

Median duration of postpartum amenorrhea

Number of months after the end of a pregnancy by which time half of women have begun menstruating.

Sample: Women who had a live birth or stillbirth in the 3 years before the survey

Median duration of postpartum insusceptibility

Number of months after the end of a pregnancy by which time half of women are no longer protected against pregnancy by either postpartum amenorrhea or abstinence from sexual intercourse.

Sample: Women who had a live birth or stillbirth in the 3 years before the survey

Postpartum amenorrhea refers to the interval between the birth of a child and the resumption of menstruation. The length and intensity of breastfeeding influence the duration of amenorrhea, which offers protection from conception. Postpartum abstinence refers to the period between childbirth and the time when a woman resumes sexual activity.

Following births in the 3 years preceding the survey, the median duration of postpartum amenorrhea is 4.8 months. Overall, women are insusceptible to pregnancy after childbirth (still amenorrheic and/or still abstaining) for a median duration of 6.4 months (**Table 5.6**).

Trends: In Cambodia, the median duration of postpartum amenorrhea has declined steadily over time, from 9.3 months in 2005 to 4.8 months in 2021–22. The median duration of insusceptibility has followed a similar pattern, decreasing from 9.9 months to 6.4 months.

Patterns by background characteristics

- The duration of postpartum insusceptibility is longer in rural areas (7.1 months) than in urban areas (5.4 months) (**Table 5.7**).
- The duration of postpartum insusceptibility is highest among women with no education (6.8 months) or a primary education (7.2 months) and lowest among women with more than a secondary education (4.3 months).
- The duration of insusceptibility decreases with increasing wealth, from 8.4 months among women in the lowest wealth quintile to 4.9 months among those in the highest quintile.

5.5 AGE OF FIRST MENSTRUATION

The age when a young woman experiences her first menstruation is an important milestone in her life. It signals the beginning of a long phase of life (around 40 years) during which she may be fertile. This means that if she has sexual contact, she might become pregnant. In Cambodia, the mean age at first menstruation among women age 15–49 is 15.1 years. About three in every five women (60%) have their first menstruation by age 15 (**Table 5.8**).

5.6 ARRIVAL OF MENOPAUSE

Menopause

Women are considered to have reached menopause if they are neither pregnant nor postpartum amenorrheic and have not had a menstrual period in the 6 months before the survey, if they report being menopausal or having had a hysterectomy, or if they have never menstruated.

Sample: Women age 30–49

Women who have reached menopause are no longer able to become pregnant. In Cambodia, 9% of women age 30–49 are menopausal. The percentage of menopausal women increases with age, from 3% among those age 30–34 to 35% among those age 48–49 (**Table 5.9**).

5.7 AGE AT FIRST BIRTH

Median age at first birth

Age by which half of women have had their first child.

Sample: Women age 20–49 and 25–49

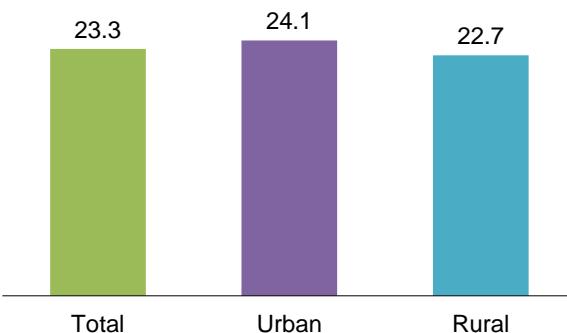

The age at which childbearing commences is an important determinant of the overall level of fertility as well as the health and well-being of the mother and child. In Cambodia, the median age at first birth among women age 25–49 is 23.3 years (**Table 5.10**). This means that half of women age 25–49 give birth for the first time before this age. Sixty-three percent of women have given birth by age 25 (**Table 5.10**).

Patterns by background characteristics

- Urban women age 25–49 begin childbearing 1.4 years later than their rural counterparts (24.1 years versus 22.7 years) (**Table 5.11** and **Figure 5.6**).
- By province, the median age at first birth ranges from 20.6 years among women in Ratanak Kiri to 24.7 years among women in Phnom Penh.
- Women with no education begin childbearing 1.5 years earlier than women with a secondary education (22.0 years versus 23.5 years).

Figure 5.6 Median age at first birth by residence

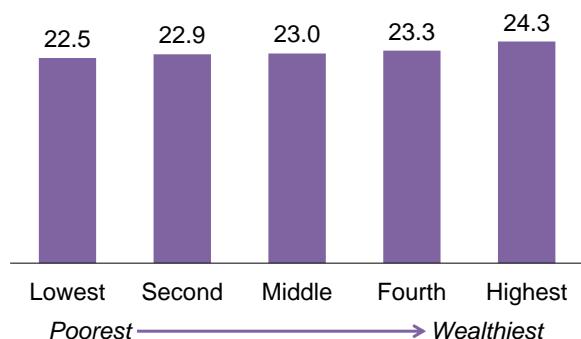

Median age at first birth among women age 25–49

- Women in the highest wealth quintile start childbearing later than women in the lowest quintile (24.3 years versus 22.5 years) (**Figure 5.7**).

Figure 5.7 Median age at first birth by household wealth

Median age at first birth among women age 25–49

5.8 TEENAGE PREGNANCY

Teenage pregnancy

Percentage of women age 15–19 who have ever been pregnant.

Sample: Women age 15–19

Teenage pregnancy is a major health concern because of its association with higher morbidity and mortality for both the mother and the child. Childbearing during adolescence is known to have adverse social consequences, particularly regarding educational attainment, as women who become mothers in their teens are more likely to drop out of school. In Cambodia, 9% of women age 15–19 have ever been pregnant (**Table 5.12**). Seven percent of young women have given birth, 3% are pregnant with their first child, and 2% have ever had a pregnancy loss.

The tendency to initiate sexual intercourse before age 15 is slightly higher among women than men (1% versus less than 1%). Two percent of women age 15–19 were married by age 15, and less than 1% had given birth or had been pregnant by that age. No men reported marrying or fathering a child before age 15 (**Table 5.13**).

Trends: The percentage of women age 15–19 who have ever been pregnant has declined since 2014, from 12% to 9%. This comparison is not completely accurate because the 2021–22 calculation includes pregnancies that ended in terminations.

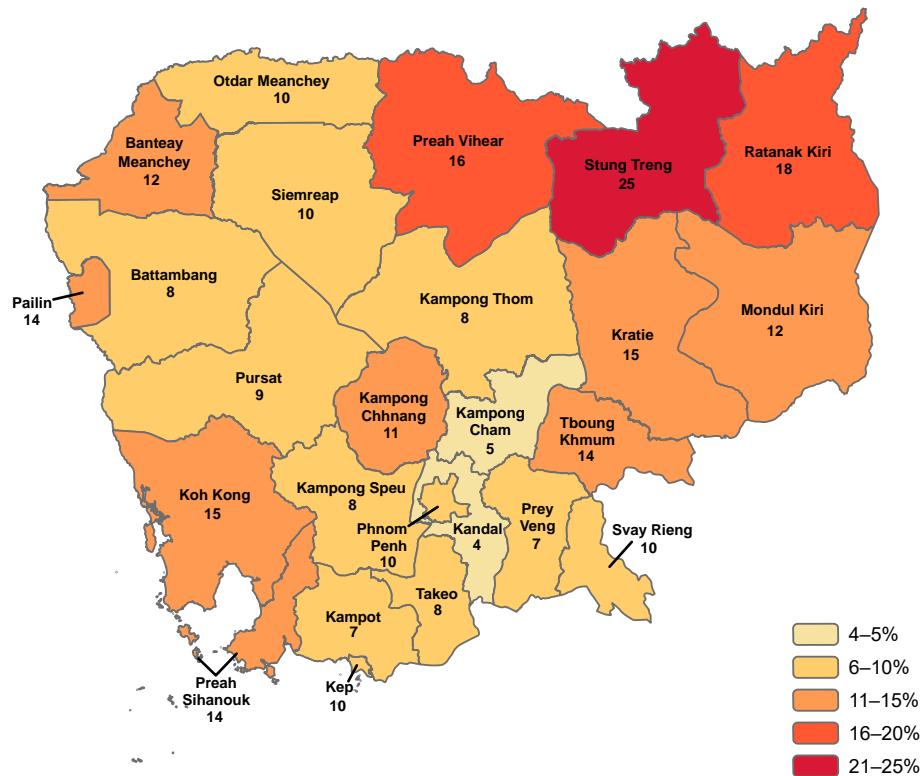

Patterns by background characteristics

- The percentage of women age 15–19 who have ever been pregnant increases with age, from 1% among those age 15 to 30% among those age 19.
- Teenage pregnancy is higher in rural areas than in urban areas (10% versus 8%) (**Table 5.12**).

- By province, the percentage of teenagers who have begun childbearing is highest in Stung Treng (25%) and lowest in Kandal (4%) (**Map 5.2**).

Map 5.2 Teenage pregnancy by province

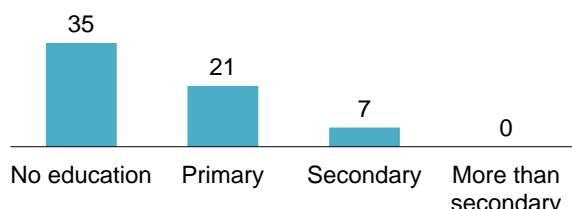

Percentage of women age 15–19 who have ever been pregnant

- The percentage of women age 15–19 who have ever been pregnant declines with increasing education, from 35% among those with no formal education to less than 1% among those with more than a secondary education (**Figure 5.8**).
- Teenage pregnancy is less common in the wealthiest households: 4% of women in the highest wealth quintile have begun childbearing, as compared with 16% of those in the lowest quintile (**Table 5.12**).

Figure 5.8 Teenage pregnancy by education

Percentage of women age 15–19 who have ever been pregnant

5.9 PREGNANCY OUTCOMES AND INDUCED ABORTION RATES

Pregnancy outcomes

Live birth: a child who was born alive, even if for a very short time

Stillbirth: a child who was born dead (no signs of life) following a pregnancy 7 months (28 weeks) or longer duration

Miscarriage: a pregnancy that ended involuntarily before completing 7 months (28 weeks)

Induced abortion: a pregnancy that was voluntarily ended

Sample: Pregnancies among women age 15–49 ending in the 3 years preceding the survey

Of all pregnancies to women age 15–49 ending in the 3 years preceding the survey, 79% resulted in live births and 21% resulted in pregnancy losses. Among pregnancy losses, 12% were miscarriages, 9% were induced abortions, and less than 1% were stillbirths (**Table 5.14** and **Figure 5.9**).

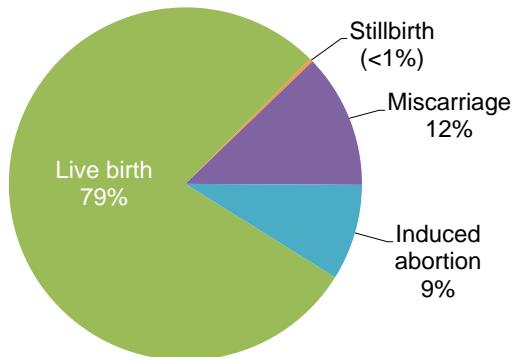

The total abortion rate (TAR) in Cambodia is 0.3 abortions per woman. The age-specific induced abortion rate increases from 4 abortions per 1,000 women in the 15–19 age group to a peak of 14 per 1,000 women in the 35–39 age group and drops thereafter. Age-specific abortion rates are slightly higher among urban women than their rural counterparts (**Table 5.15**).

Patterns by background characteristics

- Induced abortion increases with increasing pregnancy order, from 2% for the first pregnancy to 25% for the fifth pregnancy or higher (**Table 5.14**).
- Induced abortion is higher in urban areas than in rural areas (11% versus 7%) (**Table 5.14**).
- By province, induced abortion ranges from a low of 2% in Kampong Speu to a high of 19% in Kep (**Table 5.14**).

Figure 5.9 Pregnancy outcomes

Percent distribution of pregnancies ending in the 3 years before the survey

LIST OF TABLES

For more information on fertility levels and some of the determinants of fertility, see the following tables:

Note: Figures in parentheses are based on 25–49 unweighted cases.

¹ Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months.

² Miscarriages are fetal deaths in pregnancies lasting less than 28 weeks. When pregnancy duration is reported in months, miscarriages are fetal deaths in pregnancies lasting less than 7 months.

Table 5.15 Induced abortion rates

Age-specific and total induced abortion rates, and general abortion rates, for the 3 years preceding the survey, according to residence, Cambodia DHS 2021–22

Age group	Residence		
	Urban	Rural	Total
15–19	5	3	4
20–24	8	8	8
25–29	14	13	13
30–34	15	12	13
35–39	22	8	14
40–44	4	7	6
45–49	[4]	[3]	[3]
TAR (15–49)	0.4	0.3	0.3
GAR	13	9	10

Note: Age-specific induced abortion rates are per 1,000 women. Estimates in brackets are truncated. Rates are for the period 1–36 months preceding the interview.

TAR: Total induced abortion rate, expressed per woman

GAR: General induced abortion rate, expressed per 1,000 women age 15–44

FERTILITY PREFERENCES

Key Findings

- **Desire for another child:** 14% of currently married women age 15–49 want to have another child within 2 years, and 17% want to wait at least 2 years.
- **Limiting childbearing:** 53% of currently married women and 57% of currently married men age 15–49 want no more children or are sterilized.
- **Ideal family size:** In Cambodia, married women and married men desire about the same number of children (3.0 children versus 3.1 children).
- **Unwanted births:** Only 81% of births and pregnancies in the past 3 years were wanted at the time of conception, 8% were mistimed, and 11% were unwanted.
- **Wanted births:** The wanted fertility rate is 2.4, while the total fertility rate is 2.7. This suggests that Cambodian women are currently having, on average, 0.3 more children than they want.

Information on fertility preferences can help family planning program planners assess the desire for children, the extent of mistimed and unwanted pregnancies, and the demand for contraception to space or limit births. This information suggests the direction that fertility patterns could take in the future.

This chapter presents information on whether and when married women and men want more children, their ideal family size, whether the last birth was wanted, and the theoretical fertility rate if all unwanted births were prevented.

6.1 DESIRE FOR ANOTHER CHILD

Desire for another child

Women and men were asked whether they wanted more children and, if so, how long they would prefer to wait before the birth of the next child. Women and men who are sterilized are assumed not to want any more children.

Sample: Currently married women and men age 15–49

Thirty-four percent of currently married women age 15–49 want to have another child; 14% of these women want to have another child within 2 years, 17% want to wait at least 2 years, and 3% are undecided on when they would want another child. The majority of currently married women want to limit childbearing: 50% want no more children, 3% are sterilized, and 3% are infecund. Overall, 36% of currently married men age 15–49 want to have another child; 15% want to have another child within 2 years, 20% want to wait at least 2 years, and 1% are undecided with respect to time. Fifty-seven percent of currently married men want no more children, 4% are infecund, and less than 1% are sterilized (**Table 6.1**).

Trends: The proportion of currently married women who want no more children, are sterilized, or are infecund increased slightly between 2014 and 2021–22 (from 55% to 57%). Among currently married men, this proportion increased substantially from 52% in 2014 to 62% in 2021–22 (**Figure 6.1**).

Patterns by background characteristics

- The desire to limit childbearing among currently married women increases as number of living children increases, from 5% among women with no children to 91% among women with six or more children (**Table 6.2.1** and **Figure 6.2**).
- The percentage of married women who want to limit childbearing is the same in rural and urban areas (53%) (**Table 6.2.1**). However, a higher percentage of urban than rural men want no more children (62% versus 55%) (**Table 6.2.2**).
- The desire to limit childbearing decreases with increasing education among both women and men.
- The desire to limit childbearing does not have a linear relationship with household wealth.

Figure 6.1 Trends in desire to limit childbearing by number of living children

Percentage of currently married women and men age 15–49 who want no more children

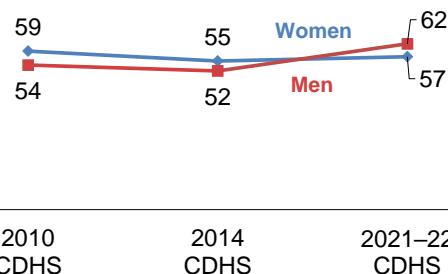

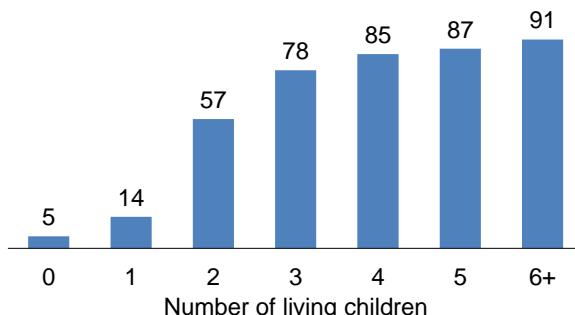

Figure 6.2 Desire to limit childbearing by number of living children

Percentage of currently married women age 15–49 who want no more children

6.2 IDEAL FAMILY SIZE

Ideal family size

Respondents with no children were asked “If you could choose exactly the number of children to have in your whole life, how many would that be?”

Respondents who had children were asked “If you could go back to the time when you did not have any children and could choose exactly the number of children to have in your whole life, how many would that be?”

Sample: Women and men age 15–49

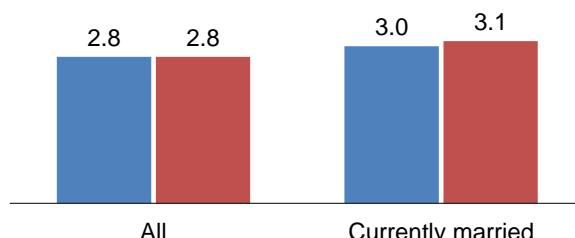

Table 6.3 shows that, on average, women and men desire the same number of children (2.8 children). This is also true among women and men who are currently married (3.0 children and 3.1 children, respectively) (**Figure 6.3**).

Trends: From 2014 to 2021–22, there was a slight decrease in the mean ideal number of children among women age 15–49, from 3.1 to 2.8 among women overall and from 3.3 to 3.0 among currently married women. A similar pattern is observed among men.

Figure 6.3 Ideal family size

Mean ideal number of children among women and men age 15–49

■ Women ■ Men

Patterns by background characteristics

- In general, the more children respondents already have, the more children they consider ideal. For example, currently married women who have no children consider 2.2 children to be ideal, whereas women with six or more children consider 4.3 children to be ideal (**Figure 6.4**).
- Ideal family size increases as women's age increases, from 2.2 children among women age 15–49 to 3.4 children among women age 45–49 (**Table 6.4**).
- The mean ideal number of children is slightly lower among urban women (2.6 children) than among rural women (2.9 children).
- Ideal family size varies by province, from 2.0 children in Kampong Thom to 3.4 children in Ratanak Kiri.
- The mean ideal number of children among women with more than a secondary education is 2.5, as compared with 3.1 among women with no education.
- Women's mean ideal number of children decreases slightly with increasing household wealth.

6.3 FERTILITY PLANNING STATUS

Planning status of births/pregnancies

Women reported whether their births/pregnancies were wanted at the time (planned birth), at a later time (mistimed birth), or not at all (unwanted birth).

Sample: Current pregnancies and live births in the 3 years before the survey among women age 15–49 and all pregnancy outcomes in the 3 years before the survey among women age 15–49

Only 81% of current pregnancies and births in the 3 years before the survey were wanted at the time of conception, 8% were mistimed (that is, wanted at a later date), and 11% were not wanted at all (**Table 6.5** and **Figure 6.5**).

Trends: The percentage of wanted births or current pregnancies dropped from 94% in 2014 to 89% in 2021–22.

Patterns by background characteristics

- Women with four or more children are more likely (35%) to describe births or current pregnancies as unwanted than women with one child (3%) or two children (8%).

Figure 6.4 Ideal family size by number of living children

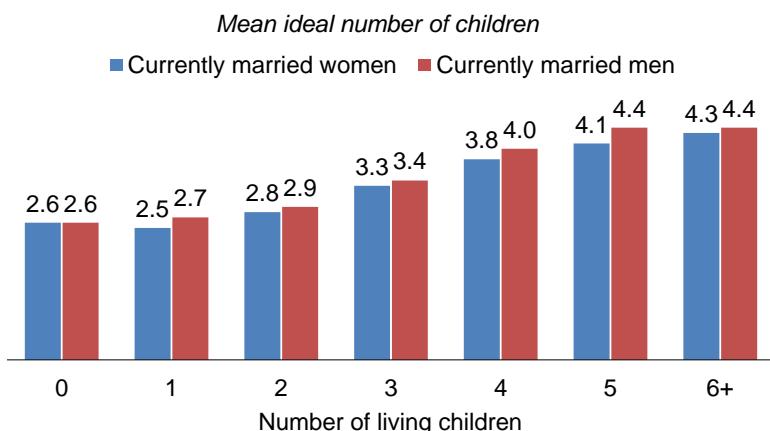

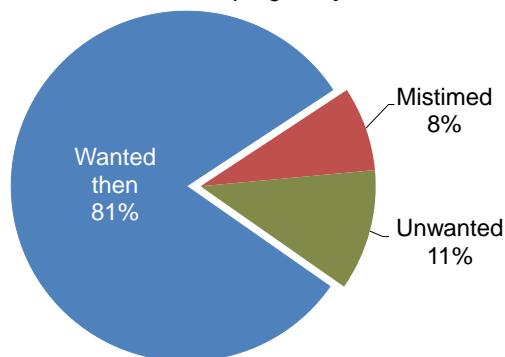

Figure 6.5 Fertility planning status

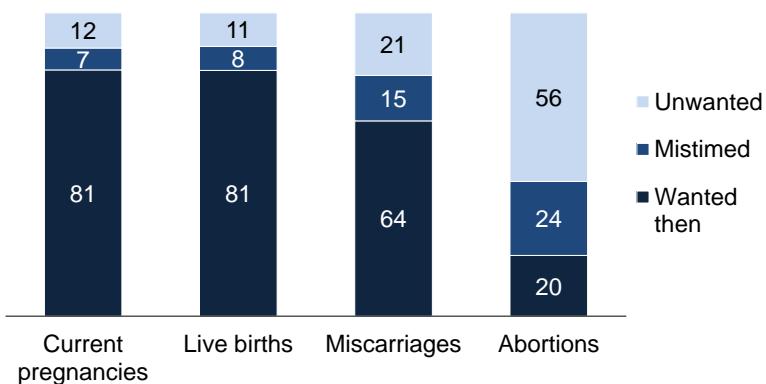

Percent distribution of pregnancy outcomes among women age 15–49 in the 3 years before the survey by planning status of pregnancy

- In general, the proportion of births or current pregnancies described as unwanted increases with age. In contrast, the percentage of births or current pregnancies that are mistimed generally decreases with increasing mother's age at the time of birth.
- Eighty percent of pregnancies that result in abortions are either unwanted (56%) or mistimed (24%) (**Figure 6.6**).

Figure 6.6 Pregnancy outcomes by fertility planning status

Percent distribution of pregnancy outcomes among women age 15–49 in the 3 years before the survey by planning status of pregnancy

6.4 WANTED FERTILITY RATES

Unwanted birth

Any birth in excess of the number of children a woman reported as her ideal number.

Wanted birth

Any birth less than or equal to the number of children a woman reported as her ideal number.

Wanted fertility rate

The average number of children a woman would have by the end of her childbearing years if she bore children at the current age-specific fertility rates, excluding unwanted births.

Sample: Women age 15–49

The total wanted fertility rate in Cambodia is 2.4 children, as compared with the actual total fertility rate (TFR) of 2.7 children (**Table 6.6**). This indicates that women in Cambodia have on average 0.3 more children than they want to have.

Trends: The total wanted fertility rate has not changed since 2014 (2.4 children). The same is true of the gap between wanted and actual fertility (0.3 children) (**Figure 6.7**).

Patterns by background characteristics

- The difference between wanted fertility and actual fertility is slightly higher in rural areas (0.3 children) than in urban areas (0.2 children).
- By province, the total wanted fertility rate is highest in Prey Veng (3.2 children) and lowest in Phnom Penh (1.9 children). The gap between wanted and actual fertility is largest in Kampong Thom (1.2 children) and smallest in Siemreap, Kampot, Kep, and Prey Veng (0.1 children each).
- The gap between wanted and actual fertility is 0.2 children among women with more than a secondary education, as compared with 0.6 children among women with no education.

LIST OF TABLES

For more information on fertility preferences, see the following tables:

¹ The number of living children includes a woman's current pregnancy.

² Wants next birth within 2 years

³ Wants to delay next birth for 2 or more years

⁴ Includes both female and male sterilization

⁵ The number of living children includes one additional child if the respondent's wife is pregnant (or if any wife is pregnant for men with more than one current wife).

Current pregnancy	81.2	7.2	11.6	100.0	828
Live birth	81.0	7.9	11.1	100.0	4,838
Stillbirth	*	*	*	100.0	18
Miscarriage	64.4	15.0	20.6	100.0	760
Abortion	20.0	24.4	55.6	100.0	541
Total	74.5	9.9	15.7	100.0	6,984

Note: Pregnancy outcome refers to a miscarriage, abortion, live birth, or stillbirth. Some pregnancies produce multiple outcomes, for example in the case of twins. In this table, each pregnancy outcome is counted individually. Therefore, a pregnancy is counted more than once if it produces multiple births (live births or stillbirths). Current pregnancies, miscarriages, and abortions are always counted as one pregnancy outcome. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ For pregnancies that resulted in multiple outcomes (for example, twins), each outcome is counted individually.

² For current pregnancies, the maternal age at birth is estimated as the mother's expected age at the time of the birth.

Table 6.6 Wanted fertility rates

Note: Rates are calculated based on births to women age 15–49 in the period 1–36 months preceding the survey. The total fertility rates are the same as those presented in Table 5.2.

FAMILY PLANNING

Key Findings

- **Contraceptive use:** 62% of currently married women use a method of contraception. The most commonly used method is the pill (26%), followed by withdrawal (16%).
- **Contraceptive discontinuation:** 28% of women who began using a contraceptive method in the 5 years preceding the survey discontinued the method within 12 months. The most common reason for discontinuation was wanting to become pregnant (38%).
- **Demand for family planning:** The total demand for family planning among currently married women increased from 69% in 2014 to 74% in 2021–22; 61% of the total demand is satisfied by modern methods.
- **Unmet need for family planning:** 12% of currently married women and 60% of sexually active unmarried women have an unmet need for family planning.
- **Future use of contraception:** 42% of currently married women who are not using contraception intend to use family planning in the future.

Couples can use contraceptive methods to limit or space the number of children they have. This chapter presents information on use and sources of contraceptive methods, informed choice of methods, and rates and reasons for discontinuing contraceptives. It also examines the potential demand for family planning and how much contact nonusers have with family planning providers.

7.1 CONTRACEPTIVE KNOWLEDGE AND USE

Contraceptive prevalence

Percentage of women who use any contraceptive method.

Sample: All women age 15–49, currently married women age 15–49, and sexually active unmarried women age 15–49

Modern methods

Include male and female sterilization, intrauterine devices (IUDs), injectables, implants, contraceptive pills, male and female condoms, emergency contraception, the standard days method, and the lactational amenorrhea method.

Nearly all women (99%) and men (98%) age 15–49 having heard of at least one contraceptive method. For more information on contraceptive knowledge by method and by background characteristics, see **Table 7.1** and **Table 7.2**.

The contraceptive prevalence (CPR) is 62% among currently married women age 15–49. Forty-five percent of currently married women use a modern method, while 17% use a traditional method. Twenty-nine percent of sexually active unmarried women use a contraceptive method, all of them using a modern method (**Table 7.3** and **Figure 7.1**).

Trends: Contraceptive use among currently married women increased from 56% in 2014 to 62% in 2021–22. Use of any modern method of contraception also increased, from 39% to 45% (**Figure 7.2**).

Patterns by background characteristics

- Only a small proportion of currently married women who do not have a child use a modern contraceptive method (5%). Among women with children, modern contraceptive method use is higher among those with three or four living children (51%) than among those with one or two children (47%) and those with five or more children (44%) (**Table 7.4**).
- Use of modern contraceptive methods is higher among currently married women in rural areas (47%) than among those in urban areas (41%) (**Figure 7.3**).

Figure 7.1 Contraceptive use

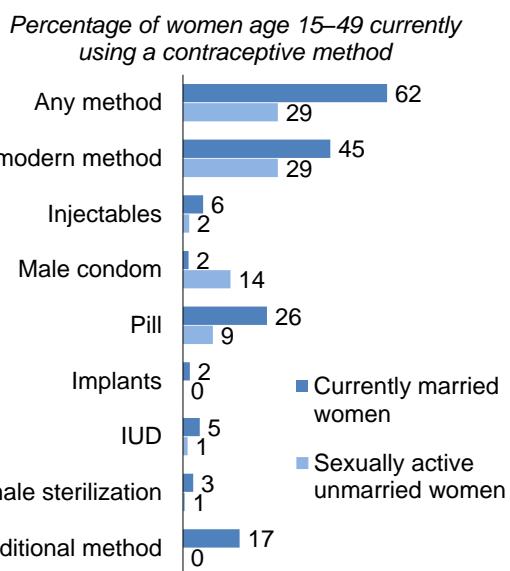

Figure 7.2 Trends in contraceptive use

Percentage of currently married women age 15–49 currently using a contraceptive method

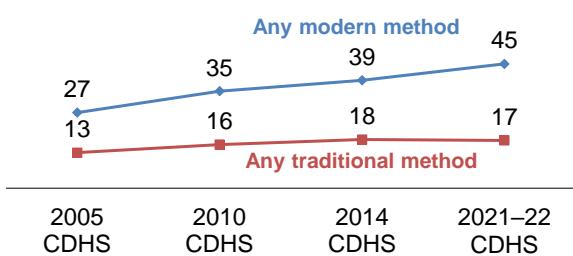

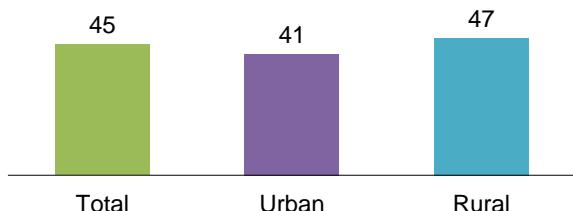

Figure 7.3 Modern contraceptive use by residence

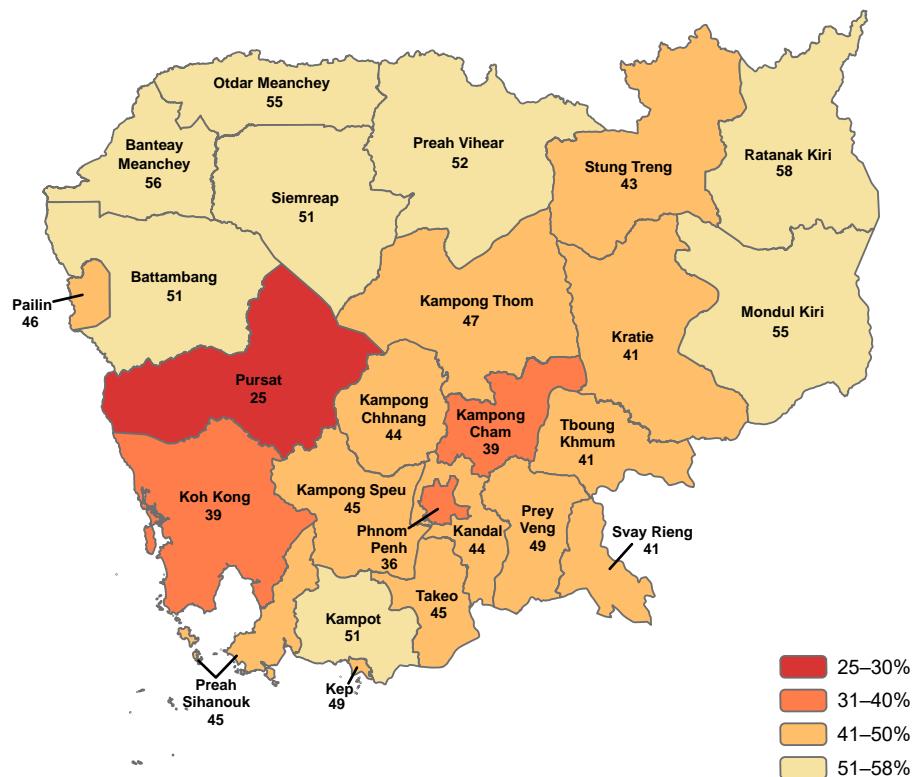

Percentage of currently married women age 15–49 using a modern contraceptive method

- Modern contraceptive use among currently married women ranges from 25% in Pursat to 58% in Ratanak Kiri (**Table 7.4** and **Map 7.1**).

Map 7.1 Modern contraceptive use by province

Percentage of currently married women age 15–49 using a modern contraceptive method

- The proportion of currently married women using modern contraceptive methods decreases with increasing education and household wealth (**Table 7.4**).
- Female sterilization increases with age to 6% among currently married women age 45–49. The median age at sterilization is 33 (**Table 7.5**).
- Nearly all women (97%) using injectables use DMPA-SC/Sayana Press. Among DMPA-SC/Sayana Press users, 99% report that the most recent injection was administered by a health care provider (**Table 7.6**).

7.1.1 Use of Emergency Contraception

Less than 1% of women age 15–49 used emergency contraception during the 12 months prior to the survey (**Table 7.7**).

7.1.2 Knowledge of the Fertile Period

Only 20% of women age 15–49 correctly reported that the fertile period during the ovulatory cycle is halfway between two menstrual periods. The large majority of women (68%) said that there is no specific time or that they don't know. However, 62% percent of women who use the rhythm method and 63% who use the standard days method have correct knowledge of the fertile period (**Table 7.8**). Twenty-seven percent of women age 30–34 have correct knowledge of the fertile period, as compared with only 7% of women age 15–19 (**Table 7.9**).

7.2 SOURCE OF MODERN CONTRACEPTIVE METHODS

Source of modern contraceptives

The place where the modern method currently being used was obtained the last time it was acquired.

Sample: Women age 15–49 currently using a modern contraceptive method

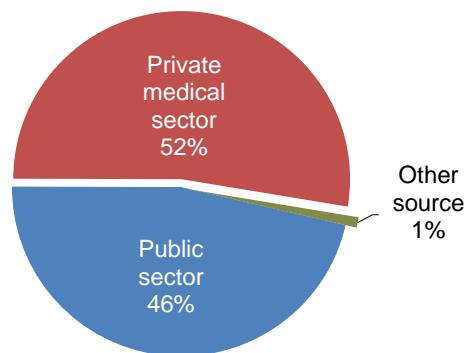

Forty-six percent of women who currently use a modern method of contraception last obtained that method from a public sector source, primarily a government health center (37%), while 52% obtained their method from the private sector (**Figure 7.4**).

The public sector is the primary source of injectables and implants (71% and 63%, respectively), while the private sector is the primary source of pills and male condoms (62% and 72%, respectively) (**Table 7.10**). Among pill users, 48% use the brand OK, 28% use Srey Pich, and 23% use pills with a single hormone (**Table 7.11**).

7.3 INFORMED CHOICE

Figure 7.4 Source of modern contraceptive methods

Percent distribution of current users of modern methods age 15–49 by most recent source of method

Figures do not add up to 100% due to rounding.

Informed choice

Informed choice indicates that women were informed about their method's side effects, about what to do if they experience side effects, and about other methods they could use.

Sample: Women age 15–49 who are currently using selected modern contraceptive methods and who started the last episode of use within the 5 years before the survey

Sixty-eight percent of women currently using modern methods of contraception were informed about side effects or other problems associated with the method they used, and 70% were told what to do if they experienced side effects. Sixty-five percent of women were informed by a health or family planning worker about other contraceptive methods available. Overall, 58% of women currently using a modern contraceptive method were provided with all three types of information at the time they started their last episode of use (**Table 7.12**).

7.4 DISCONTINUATION OF CONTRACEPTIVES

Contraceptive discontinuation rate

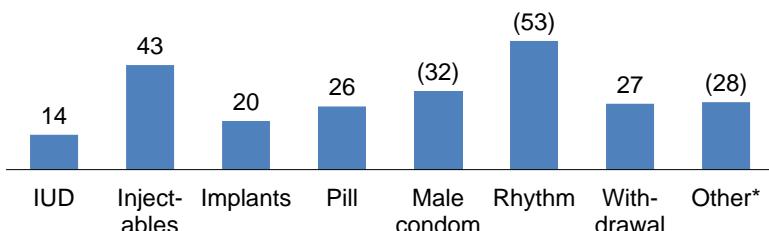

Percentage of contraceptive use episodes discontinued within 12 months.

Sample: Episodes of contraceptive use in the 5 years before the survey experienced by women who are currently age 15–49 (one woman may contribute more than one episode)

Twenty-eight percent of contraceptive episodes that were started used by women in the 5 years before the survey were discontinued within 12 months. Discontinuation rates were highest for the rhythm method and injectables (**Table 7.13** and **Figure 7.5**). The most common reasons for contraceptive discontinuation in the 5 years before the survey were desire to become pregnant (38%) and health concerns or side effects (17%) (**Table 7.14**).

Figure 7.5 Contraceptive discontinuation rates

Percentage of contraceptive episodes discontinued within 12 months

Note: Values in parentheses are based on 25–49 unweighted cases.

* Includes LAM and male sterilization, emergency contraceptive, SDM

7.5 DEMAND FOR FAMILY PLANNING

Unmet need for family planning

Proportion of women who (1) are not pregnant and not postpartum amenorrheic and are considered fecund and want to postpone their next birth for 2 or more years or stop childbearing altogether but are not using a contraceptive method, (2) have a mistimed or unwanted current pregnancy, or (3) are postpartum amenorrheic and their last birth in the last 2 years was mistimed or unwanted.

Met need for family planning

Current contraceptive use (any method).

Sample: All women age 15–49, currently married women age 15–49, and sexually active unmarried women age 15–49

Demand for family planning: Unmet need for family planning + met need (current contraceptive use [any method])

Proportion of demand satisfied: $\frac{\text{Current contraceptive use (any method)}}{\text{Unmet need} + \text{current contraceptive use (any method)}}$

Proportion of demand satisfied by modern methods: $\frac{\text{Current contraceptive use (any modern method)}}{\text{Unmet need} + \text{current contraceptive use (any method)}}$

In Cambodia, 12% of currently married women have an unmet need for family planning, 5% for spacing births and 7% for limiting births. About three in five (62%) currently married women are already using contraception (met need) either to space (24%) or to limit (38%) births (**Figure 7.6**). Overall, 84% of the demand for family planning is satisfied, primarily by modern methods (61%) (**Table 7.15.1**).

Table 7.15.2 presents information on need and demand for family planning among all women and sexually active unmarried women according to various background characteristics.

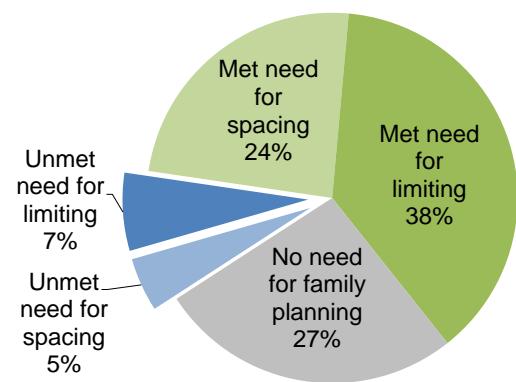

Trends: From 2014 to 2021–22, demand for family planning among currently married women increased from 69% to 74%. Over this same period, the total demand satisfied by modern methods increased from 56% to 61%.

Patterns by background characteristics

- Unmet need for spacing births decreases with age, from 14% among currently married women age 15–19 to 1% among those age 45–49. In contrast, unmet need for limiting births generally increases with increasing age.
- Unmet need for family planning varies by province, ranging from a high of 30% among currently married women in Pursat to a low of 6% in Kampot (**Map 7.2**).

Figure 7.6 Demand for family planning

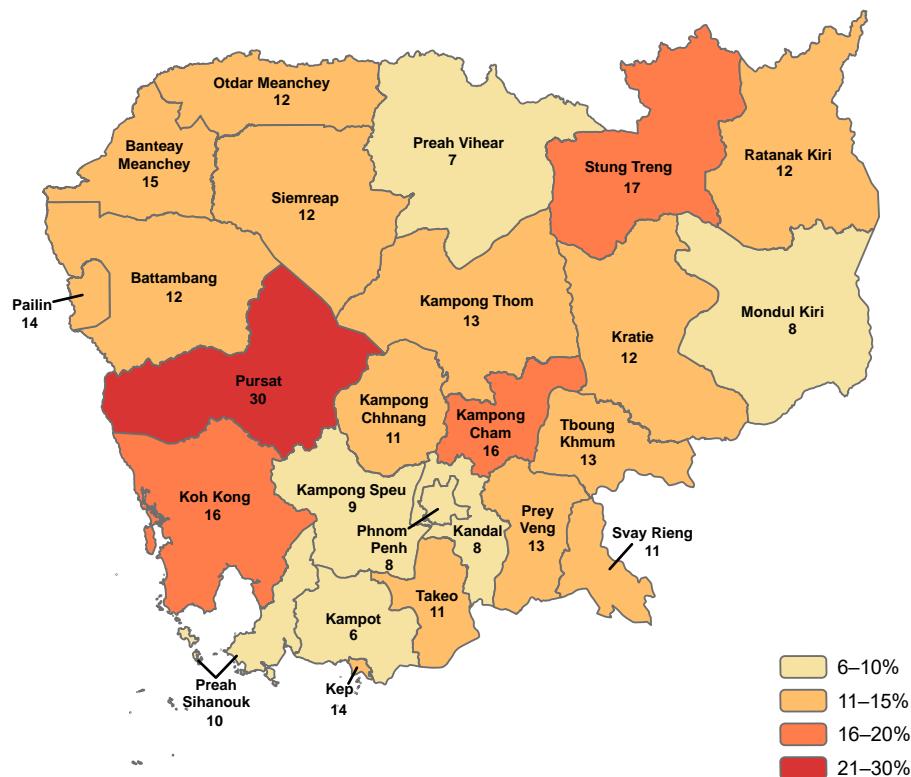

Percent distribution of currently married women age 15–49 by need for family planning

Note: Figures do not add up to 100% due to rounding.

Map 7.2 Unmet need by province

Percentage of currently married women age 15–49 with unmet need for family planning

- Unmet need for family planning is higher among currently married women with no formal education (14%) than among currently married women with more than a secondary education (9%) (**Figure 7.7**).

7.5.1 Decision Making about Family Planning and Opinion about Using Family Planning

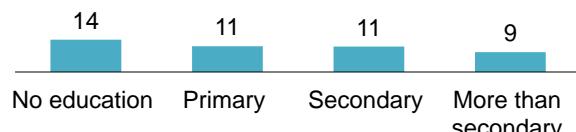

Among currently married women, 57% said that the decision to use or not use contraception was made jointly with their husband, 37% reported that they made their own decision, and 6% said that it was mainly their husband's decision (**Table 7.16**). Among currently married women, 37% reported that they made their own decision, 57% said that they decided jointly with their husband, and 6% said that it was mainly their husband's decision. Overall, 93% of currently married women participate in decision making about family planning (**Table 7.17**).

7.5.2 Pressure to Become Pregnant and Future Use of Contraception

Four percent of currently married women reported that they were pressured by their husbands/partners or any other family member to become pregnant when they did not want to (**Table 7.18**). Overall, 42% of currently married women who are not using any contraceptive method intend to use contraception in the future. One in every two nonusers (50%) do not plan to use contraception in the future, and 7% are unsure (**Table 7.19**).

Figure 7.7 Unmet need by education

Percentage of currently married women age 15–49 with unmet need for family planning

7.5.3 Exposure to Family Planning Messages

The survey also collected information on exposure to family planning messages in the media and other sources among women and men age 15–49. Posters/leaflets/brochures and social media such as Facebook, Twitter, and Instagram are the most common sources of family planning messages. Fifty-five percent of women and 26% of men saw a family planning message on a poster/leaflet/brochure, and 37% of women and 34% of men saw a message on social media. On the other hand, 27% of women and 48% of men have not been exposed to family planning messages through any of the specified sources in the past few months (**Table 7.20.1** and **Table 7.20.2**).

7.6 CONTACT OF NONUSERS WITH FAMILY PLANNING PROVIDERS

Contact of nonusers with family planning providers

Respondent discussed family planning in the 12 months before the survey with a fieldworker or during a visit to a health facility.

Sample: Women age 15–49 who are not currently using any contraceptive methods

Nine in 10 women (90%) who are not currently using any contraceptive method reported that they did not discuss family planning with a fieldworker or during a health facility visit in the 12 months preceding the survey. One in 10 women (10%) visited a health facility and discussed family planning, and 22% visited a health facility but did not discuss family planning. Only 2% were visited by a fieldworker who discussed family planning (**Table 7.21**).

Patterns by background characteristics

- The proportion of women who did not discuss family planning either with a fieldworker or at a health facility is higher in urban areas (93%) than in rural areas (87%).
- The percentage of women who did not discuss family planning with a fieldworker or during a health facility visit ranges from 78% each in Kratie and Stung Treng to 97% in Phnom Penh.
- Women in the lowest wealth quintile are more likely to have discussed family planning either with a fieldworker (3%) or during a health facility visit (15%) than those in the highest quintile (1% and 5%, respectively).

Notes: Table includes users of only the methods listed individually. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

Na = Not applicable

NGO = Nongovernmental organization

¹ The method information index is the percentage of women who were informed about (1) side effects or problems of the method used, (2) what to do if they experienced side effects, and (3) other methods that could be used.

² Source at start of current episode of use

Table 7.13 Twelve-month contraceptive discontinuation rates

Among episodes of contraceptive use experienced within the 5 years preceding the survey, percentage of episodes discontinued within 12 months, according to reason for discontinuation and specific method, Cambodia DHS 2021–22

Method	Method failure	Desire to become pregnant	Other fertility-related reasons ¹	Changes in menstrual bleeding	Other side effects/ health concerns	Wanted more effective method	Other method-related reasons ²	Husband/partner disapproved	Other reasons ³	Any reason ⁴	Switched to another method ⁵	Number of episodes of use ⁶
Female sterilization	(0.0)	(0.0)	(0.0)	(0.0)	(0.0)	(0.0)	(0.0)	(0.0)	(0.0)	(0.0)	(0.0)	217
IUD	0.6	4.2	0.6	0.6	6.0	1.0	0.9	0.2	0.2	14.4	3.9	636

All methods	3.0	7.8	2.8	1.8	5.9	3.6	1.5	0.7	0.6	27.7	6.5	9,502

Notes: Figures are based on life table calculations using information on episodes of use that occurred 3–62 months preceding the survey. Figures in parentheses are based on 125–249 women exposed to method use.

¹ Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation

² Includes lack of access/too far, costs too much, and inconvenient to use

³ Includes up to God/fatalistic and other reasons

⁴ Reasons for discontinuation are mutually exclusive and add to the total given in this column.

⁵ A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave “wanted a more effective method” as the reason for discontinuation and started another method within 2 months of discontinuation.

⁶ All episodes of use that occurred within the 5 years preceding the survey are included. Episodes of use include both episodes that were discontinued during the period of observation and episodes of use that were not discontinued during the period of observation.

⁷ Includes lactational amenorrhea method (LAM), male sterilization, emergency contraception, and standard days method (SDM)

Table 7.14 Reasons for discontinuation

Percent distribution of discontinuations of contraceptive methods in the 5 years preceding the survey by main reason stated for discontinuation, according to specific method, Cambodia DHS 2021–22

Reason	IUD	Injectables	Implants	Pill	Male condom	SDM	Rhythm	Withdrawal	Other ¹	All methods
Became pregnant while using	2.0	1.6	0.2	5.6	10.4	24.8	22.5	28.4	*	11.3

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012.

¹ Total demand is the sum of unmet need and met need.

² Percentage of demand satisfied is met need divided by total demand.

³ Modern methods include female sterilization, male sterilization, IUD, injectables, implants, pill, male condom, female condom, emergency contraception, standard days method (SDM), lactational amenorrhea method (LAM), and other modern methods.

Table 7.15.2 Need and demand for family planning for all women and for sexually active unmarried women

Percentage of all women and sexually active unmarried women age 15–49 with unmet need for family planning, percentage with met need for family planning, total demand for family planning, and percentage of the demand for family planning that is satisfied, and percentage of the demand for family planning that is satisfied by modern methods, according to background characteristics, Cambodia DHS 2021–22

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012.

¹ Total demand is the sum of unmet need and met need.

² Percentage of demand satisfied is met need divided by total demand.

³ Modern methods include female sterilization, male sterilization, IUD, injectables, implants, pill, male condom, female condom, emergency contraception, standard days method (SDM), and lactational amenorrhea method (LAM), and other modern methods.

⁴ Women who have had sexual intercourse within 30 days preceding the survey

Table 7.16 Decision making about family planning

Percent distribution of currently married women by person who usually makes the decision to use or not use family planning, Cambodia DHS 2021–22

Decision maker	Percentage
Mainly wife	36.5
Wife and husband/partner jointly	56.8
Wife's opinion more important	4.4
Wife's and husband's/partner's opinion equally important	51.1
Wife's opinion less important than husband's/partner's	0.7
Missing	0.7
Mainly husband	6.0
Someone else/other	0.6
Total	100.0
Number of currently married women	13,492

Table 7.17 Decision making about family planning by background characteristics

Percent distribution of currently married women age 15–49 by person who usually makes the decision to use or not use family planning and percentage who participate in the decision to use or not use family planning, according to background characteristics, Cambodia DHS 2021–22

Background characteristic	Mainly wife	Wife and husband/partner jointly	Mainly husband/partner	Someone else/other	Total	Percentage who participate in decision making about family planning	Number of women

INFANT AND CHILD MORTALITY

Key Findings

- **Mortality levels:** During the 5 years preceding the survey, the infant mortality rate was 12 deaths per 1,000 live births, the under-5 mortality rate was 16 deaths per 1,000 live births, the neonatal mortality rate was 8 deaths per 1,000 live births, and the postneonatal mortality rate was 4 deaths per 1,000 live births.
- **Perinatal mortality:** The perinatal mortality rate is 12 deaths per 1,000 pregnancies of 7 or more months' duration.
- **Trends:** The infant mortality rate declined from 28 deaths per 1,000 live births in the 5 years before the 2014 survey to 12 deaths per 1,000 live births in the 5 years before the 2021–22 survey. Over the same period, the under-5 mortality rate declined from 35 deaths per 1,000 live births to 16 deaths per 1,000 live births.
- **Patterns:** The infant mortality rate and the under-5 mortality rate are highest in Ratanak Kiri and lowest in Phnom Penh. In addition, infant mortality and under-5 mortality are considerably higher in rural areas than in urban areas.
- **Short birth intervals:** Infant and under-5 mortality rates are highest among children with birth intervals of less than 2 years (35 and 43 deaths per 1,000 live births, respectively).

Information on infant and child mortality is relevant to a demographic assessment of a country's population and is an important indicator of the country's socioeconomic development and quality of life. It can also help identify children who may be at higher risk of death and lead to strategies to reduce this risk, such as promoting birth spacing.

This chapter presents information on levels, trends, and differentials in perinatal, neonatal, infant, and under-5 mortality rates. It also examines biodemographic factors and fertility behaviors that increase mortality risks for infants and children. The information was collected as part of a retrospective pregnancy history in which female respondents listed all of the children to whom they had given birth, along with each child's date of birth, survivorship status, and current age or age at death.

The quality of mortality estimates calculated from pregnancy histories depends on the mother's ability to recall all of the children she has given birth to, as well as their birth dates and ages at death. Potential data quality problems include:

- The selective omission from pregnancy histories of those births that did not survive, which can result in underestimation of childhood mortality.
- The displacement of birth dates, which may distort mortality trends. This can occur if an interviewer knowingly records a birth as occurring in a different year than the one in which it occurred. This may happen if an interviewer is trying to cut down on his or her overall workload, because live births

occurring during the 3 years before the interview are the subject of a lengthy set of additional questions.

- The quality of reporting of age at death. Misreporting the child's age at death may distort the age pattern of mortality, especially if the net effect of the age misreporting is to transfer deaths from one age bracket to another.
- Any method of measuring childhood mortality that relies on mothers' reports (e.g., birth histories) assumes that female adult mortality is not high or, if it is high, that there is little or no correlation between the mortality risks of mothers and those of their children.

Selected indicators of the quality of the mortality data on which the estimates of mortality in this chapter are based are presented in Appendix C, **Tables C.5** and **C.6**.

8.1 INFANT AND CHILD MORTALITY

Neonatal mortality: The probability of dying within the first month of life.

Postneonatal mortality: The probability of dying between the first month of life and the first birthday (computed as the difference between infant and neonatal mortality).

Infant mortality: The probability of dying between birth and the first birthday.

Child mortality: The probability of dying between the first and the fifth birthday.

Under-5 mortality: The probability of dying between birth and the fifth birthday.

During the 5 years immediately preceding the survey, the neonatal mortality rate was 8 deaths per 1,000 live births, the infant mortality rate was 12 deaths per 1,000 live births, and the under-5 mortality rate was 16 deaths per 1,000 live births (**Table 8.1**). Neonatal deaths account for two-thirds of infant deaths.

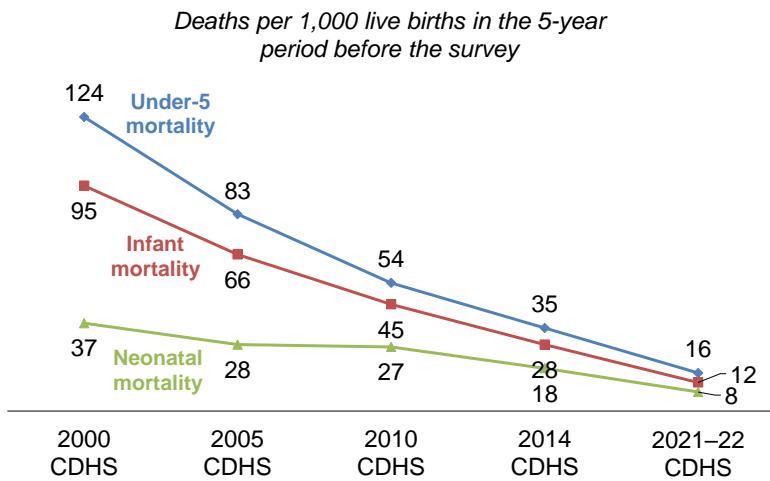

Table 8.2 and **Table 8.3** present data on childhood mortality rates by demographic characteristics (e.g., sex of the child, residence, mother's age at birth, and birth order).

Trends: The neonatal mortality rate has declined over time, from 37 deaths per 1,000 live births in 2000 to 8 deaths per 1,000 live births in 2021–22. During the same period, the infant mortality rate has declined from 95 deaths per 1,000 live births to 12 deaths per 1,000 live births, while the under-5 mortality rate has declined from 124 deaths per 1,000 live births to 16 deaths per 1,000 live births (**Figure 8.1**).

Patterns by background characteristics

- The infant mortality and under-5 mortality rates are higher in rural areas (15 deaths per 1,000 live births and 20 deaths per 1,000 live births, respectively) than in urban areas (8 deaths per 1,000 live births and 11 deaths per 1,000 live births, respectively) (**Table 8.2**).

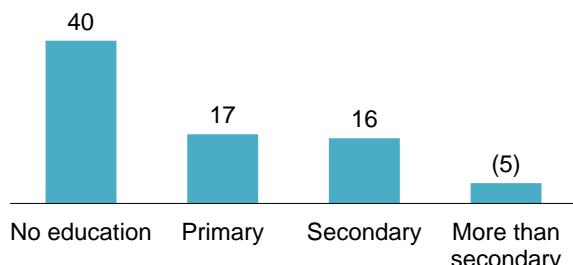

Figure 8.1 Trends in early childhood mortality rates

- Early childhood mortality generally declines with increasing mother's education (Table 8.3 and Figure 8.2).
- By province, the under-5 mortality rate is lowest in Phnom Penh (5 deaths per 1,000 live births) and highest in Ratanak Kiri (43 deaths per 1,000 live births) (Map 8.1).
- Infant mortality is highest among children of mothers who were less than age 20 at the time of the birth and children of mothers who were age 30 or older.

Figure 8.2 Under-5 mortality by mother's education

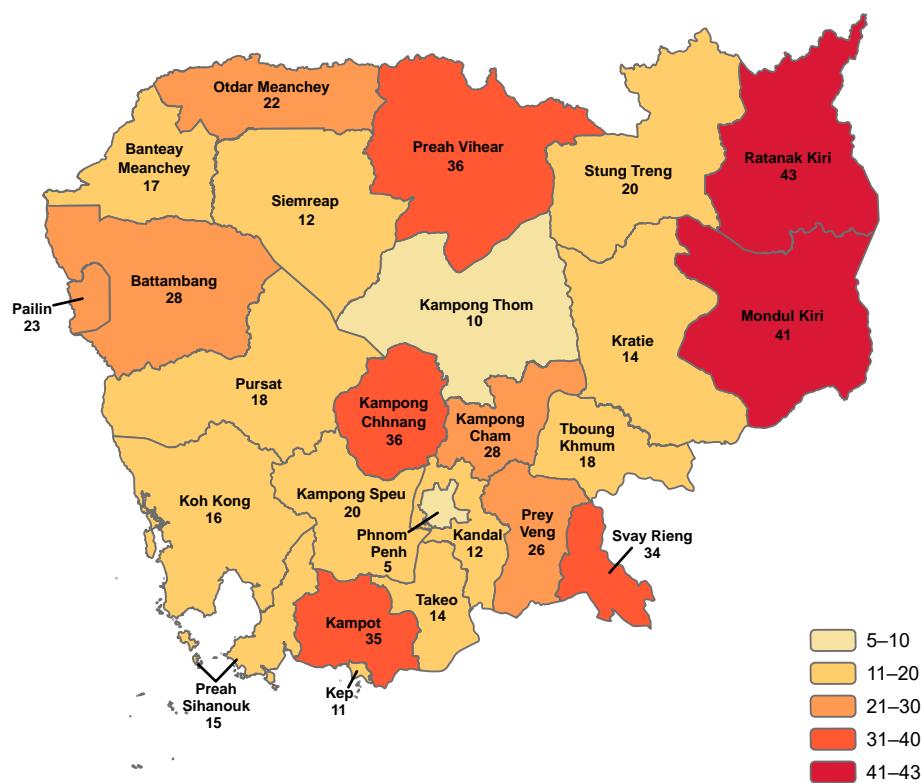

Deaths per 1,000 live births for the 10-year period before the survey

Note: Figures in parentheses are based on 250–499 unweighted person-years of exposure to the risk of death.

Map 8.1 Under-5 mortality by province

Deaths per 1,000 live births for the 10-year period before the survey

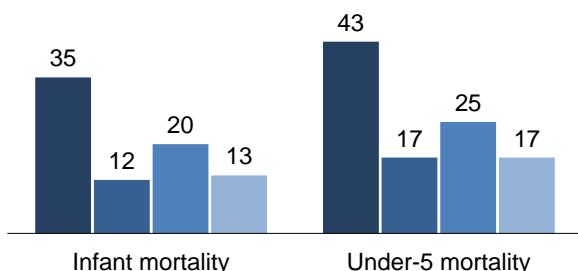

- The under-5 mortality rate increases with increasing birth order, from 16 deaths per 1,000 live births for first-order births to 34 deaths per 1,000 live births for fourth- to sixth-order births. This relationship is also observed for infant mortality.

- The infant mortality rate and the under-5 mortality rate are highest among children with birth intervals of 23 months or shorter (35 deaths per 1,000 live births and 43 deaths per 1,000 live births, respectively) (**Figure 8.3**).
- Early childhood mortality rates do not have a linear relationship with household wealth.

Figure 8.3 Childhood mortality by previous birth interval

Deaths per 1,000 live births for the 10-year period before the survey

Previous birth interval:
■ <2 years ■ 2 years ■ 3 years ■ 4+ years

8.2 PERINATAL MORTALITY

Perinatal mortality rate

Perinatal deaths comprise stillbirths (pregnancy losses occurring after 7 months of gestation) and early neonatal deaths (deaths of live births within the first 7 days of life). The perinatal mortality rate is calculated as the number of perinatal deaths per 1,000 pregnancies of 7 or more months' duration.

Sample: Number of pregnancies of 7 or more months' duration among women age 15–49 in the 5 years before the survey

The causes of stillbirths and early neonatal deaths are closely linked, and it can be difficult to determine whether a death is one or the other. The perinatal mortality rate encompasses both stillbirths and early neonatal deaths and offers a better measure of the level of mortality and quality of service around delivery. During the 5 years before the survey, the perinatal mortality rate was 12 deaths per 1,000 pregnancies (**Table 8.4**).

In 2014, the Every Newborn Action Plan, a global multipartner movement to end preventable maternal and newborn deaths and stillbirths, set a target for national stillbirth rates of 12 or fewer stillbirths per 1,000 births in all countries by 2030 (WHO 2014).

Patterns by background characteristics

- The perinatal mortality rate is higher in rural areas than in urban areas (15 deaths per 1,000 pregnancies versus 8 deaths per 1,000 pregnancies).
- By province, the perinatal mortality rate is highest in Ratanak Kiri (26 deaths per 1,000 pregnancies).

- The perinatal mortality rate is highest for pregnancies with an interval of less than 15 months (18 deaths per 1,000 pregnancies) and lowest for those with an interval of 27–38 months (7 deaths per 1,000 pregnancies).
- The perinatal mortality rate declines with increasing mother's education, from 17 deaths per 1,000 pregnancies among mothers with no formal education to less than 1 death per 1,000 pregnancies among those with more than a secondary education (**Figure 8.4**).

8.3 HIGH-RISK FERTILITY BEHAVIOR

The survival of infants and children depends in part on the demographic and biological characteristics of their mothers. Typically, the probability of dying in infancy is much greater among children born to mothers who are too young (under age 18) or too old (over age 34), children born after a short birth interval (less than 24 months after the preceding birth), and children born to mothers of high parity (more than three children). **Table 8.5** shows the percent distribution of children born in the 5 years preceding the survey by category of elevated risk of mortality (along with risk ratios) and the percent distribution of currently married women by their category of risk if they were to conceive a child at the time of the survey.

Forty-one percent of births in the 5 years preceding the survey were not in any high-risk category. Thirty-two percent of births were in an unavoidable risk category, that is, first-order births to women age 18–34. Twenty percent of births were in a single high-risk category: mother's age less than 18 years (3%), mother's age more than 34 years (8%), birth interval less than 24 months (5%), and birth order greater than three (4%). Finally, 7% of births were in multiple high-risk categories.

The risk ratio denotes the relationship between risk factors and actual mortality. A risk ratio greater than one means that exposure to a particular risk factor increases risk, while a risk ratio less than one means that exposure decreases risk. Among births in a single high-risk category, the risk ratio is highest for births that occurred within 24 months of a previous birth (2.41), followed by births to mothers age 35 or older (1.96) and fourth- or higher-order births (1.60). Overall, the risk ratio is higher for births in multiple high-risk categories than for births in a single high-risk category (3.39 versus 1.92). The risk of dying is almost four times higher among children with a birth interval of less than 24 months and a birth order above three (3.92) than among children not in any high-risk category.

Overall, two thirds (66%) of currently married women have the potential for a high-risk birth, with 35% falling into a single high-risk category and 31% falling into a multiple high-risk category.

LIST OF TABLES

For more information on infant and child mortality, see the following tables:

Note: Respondents may choose to report the duration of their pregnancy in either weeks or months.

¹ Stillbirths are fetal deaths in pregnancies lasting 28 or more weeks. When pregnancy duration is reported in months, stillbirths are fetal deaths in pregnancies lasting 7 or more months.

² Early neonatal deaths are deaths at age 0–6 days among live-born children.

³ The number of stillbirths divided by the number of pregnancies lasting 28 or more weeks, expressed per 1,000

⁴ The number of early neonatal deaths divided by the number of live births, expressed per 1,000

⁵ The sum of the number of stillbirths and early neonatal deaths divided by the number of pregnancies lasting 28 or more weeks, expressed per 1,000

⁶ Includes pregnancies lasting 7 or more months when duration of pregnancy is reported in months

⁷ Pregnancy interval categories correspond to birth interval categories of <24 months, 24–35 months, 36–47 months, and 48+ months assuming a pregnancy duration of 9 months.

Table 8.5 High-risk fertility behavior

Percent distribution of children born in the 5 years preceding the survey by category of elevated risk of mortality and the risk ratio, and percent distribution of currently married women by category of risk if they were to conceive a child at the time of the survey, Cambodia DHS 2021–22

Risk category	Births in the 5 years preceding the survey		Percentage of currently married women ¹
	Percentage of births	Risk ratio

Number of births/women	7,906	na	13,492

Note: Risk ratio is the ratio of the proportion dead among births in a specific high-risk category to the proportion dead among births not in any high-risk category. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

na = not applicable

¹ Women are assigned to risk categories according to the status they would have at the birth of a child if they were to conceive at the time of the survey: current age less than 17 years and 3 months or older than 34 years and 2 months, latest birth less than 15 months ago, or latest birth being of order 3 or higher.

² Includes the category age <18 and birth order >3

^a Includes sterilized women

Key Findings

- **Antenatal care:** Almost all women (99%) age 15–49 who had a live birth in the 2 years preceding the survey received antenatal care (ANC) from a skilled provider during their most recent birth. Eighty-six percent had at least four ANC visits.
- **Components of antenatal care:** Almost all women who received antenatal care for their most recent pregnancy had their blood pressure measured (99%), 88% had a blood sample taken, and 76% had a urine sample taken.
- **Delivery services:** Nearly all births in the past 2 years were delivered in a health facility (98%).
- **Postnatal care:** 85% of mothers, 77% of newborns, and 74% of both mothers and newborns had a postnatal check during the first 2 days after delivery.

Health care services during pregnancy and childbirth and after delivery are important for the survival and well-being of both the mother and the infant. Antenatal care (ANC) can reduce health risks for mothers and infants through monitoring of pregnancies and screening for complications. Delivery at a health facility, with skilled medical attention and hygienic conditions, reduces the risk of complications and infections during labor and delivery. Timely postnatal care provides an opportunity to treat complications arising from delivery and teach the mother how to care for herself and her newborn.

The first part of this chapter presents information on ANC providers, number and timing of ANC visits, and various components of care. The second focuses on childbirth and provides information on place of delivery, assistance during delivery, and cesarean deliveries. The third section focuses on postnatal care and presents information on postnatal health checks for mothers and newborns and men's involvement in maternal health care. The final section covers issues that affect women's health regardless of their maternal status: whether or not women have been examined for breast or cervical cancer, problems they experience accessing health care, and the distance from their home to the nearest health facility.

9.1 ANTENATAL CARE COVERAGE AND CONTENT

9.1.1 Skilled Providers

Antenatal care (ANC) from a skilled provider

Pregnancy care received from skilled providers, such as doctors, nurses/midwives, and auxiliary midwives.

Sample: Women age 15–49 who had a live birth or stillbirth in the 2 years before the survey

Almost all women (99%) age 15–49 who had a live birth in the 2 years preceding the survey received ANC from a skilled provider at least once for their most recent birth (**Table 9.1**). Most women (84%) received ANC from a nurse or midwife, while 12% received care from a doctor and 2% from an auxiliary midwife.

Trends: The percentage of women in Cambodia receiving ANC from a skilled provider at least once for their most recent birth in the 2 years preceding the survey has risen by 3 percentage points since 2014, from 96% to 99% (**Figure 9.1**).

Patterns by background characteristics

- More women in urban areas (22%) than in rural areas (7%) reported receiving antenatal care from a doctor. In contrast, more rural women (89%) than their urban counterparts (76%) received ANC from nurses and midwives (**Table 9.1**).
- In Phnom Penh, nearly two in five women (37%) reported receiving ANC from a doctor, as compared with no women in Kampong Chhnang and Kampong Speu.
- The higher a woman's educational level, the more likely she is to receive ANC from a doctor. Thirty-eight percent of women with more than a secondary education received ANC from a doctor, as compared with 6% of women with no education.
- Women from households in the highest wealth quintile are more likely to receive ANC from a doctor (33%) than those from households in the lowest wealth quintile (3%).

9.1.2 Timing and Number of ANC Visits

Eighty-six percent of women age 15–49 had at least four ANC visits during their last pregnancy resulting in a live birth in the last two years, while 12% of women had two or three ANC visits and 1% had one visit (**Table 9.2**). Another 1% of women received no antenatal care during their last pregnancy. Twenty-eight percent of women had eight or more ANC visits. Urban women were more likely to have at least four antenatal care visits (91%) than rural women (83%). Nearly 9 in 10 women (87%) had their first ANC visit during the first trimester of their pregnancy; 10% had their first visit during months 4–6 of their pregnancy, while 2% first received ANC in the seventh month or later. The median gestational age at which women made their first ANC visit was 2.2 months.

Trends: The percentage of women who had at least four ANC visits increased between 2014 (76%) and 2021–22 (86%). Over the same period, there was also an increase in the percentage of women who had their first ANC visit in the first trimester, from 79% to 87% (**Figure 9.1**).

9.2 COMPONENTS OF ANC

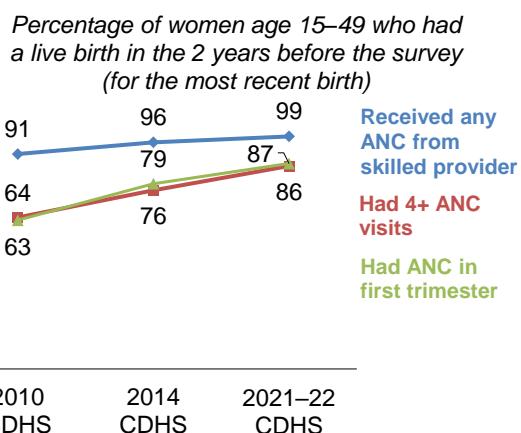

Components of antenatal care

Specific antenatal care services performed by a health care provider include measuring blood pressure, taking a urine sample, taking a blood sample, listening for the baby's heartbeat, counseling about the mother's diet, counseling about breastfeeding, and asking about vaginal bleeding.

Sample – quality of care indicator: Women age 15–49 who had a live birth or stillbirth in the 2 years before the survey and had at least one ANC visit

Sample – population-based indicator: All women age 15–49 who had a live birth or stillbirth in the 2 years before the survey

Figure 9.1 Trends in antenatal care coverage

The ability for ANC to act as an effective intervention for identifying issues occurring during pregnancy that could adversely affect pregnancy outcomes is dictated in large part by the components of ANC services offered by the health care provider.

As a part of ANC, certain interventions and tests are recommended at each ANC contact. These include the following:

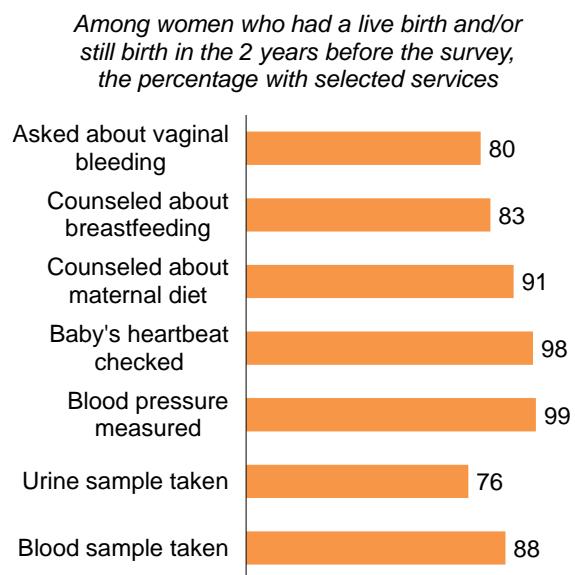

- Measuring blood pressure. Taking a woman's blood pressure at each antenatal care visit is essential to monitor for gestational hypertension or preeclampsia.
- Conducting urine and blood tests. These tests assess signs of infection or other diseases and conditions that could negatively affect a woman or her baby during or after pregnancy.
- Listening to the baby's heartbeat. This can confirm that the fetus is alive as well as reassure the mother.
- Counseling on maternal nutrition, specifically on healthy eating during pregnancy and breastfeeding. These counseling messages promote healthy weight gain during pregnancy and can help the pregnant woman breastfeed her newborn early.
- Asking about vaginal bleeding. Light bleeding or spotting is common, especially during the first few months of a pregnancy. Heavy bleeding may be a sign of something more serious; a pregnant woman experiencing heavy bleeding should visit a health care provider.

In the 2021–22 CDHS, data collected on components of ANC were tabulated in two ways. **Table 9.3.1** shows the percentage of women with a live birth or stillbirth in the 2 years before the survey who received ANC and reported receiving specified ANC services; this tabulation is a measure of the quality of the ANC services these women received. **Table 9.3.2** shows the percentage of all women with a live birth or stillbirth in the last 2 years who received specified ANC services, regardless of whether they reported an ANC visit; this tabulation is a measure of coverage of these key ANC interventions among the population of women in need of them.

Among women who had a live birth or stillbirth in the 2 years before the survey and reported that they had at least one ANC visit, 99% had their blood pressure measured, 88% had a blood sample taken, and 76% had a urine sample taken. Also, the majority said that the provider listened to the baby's heartbeat (98%), provided counseling on maternal diet (91%) and on breastfeeding (83%), and asked about vaginal bleeding (80%) (**Table 9.3.1** and **Figure 9.2**). Similar results were found for all women who had a live birth or stillbirth in the 2 years before the survey (**Table 9.3.2**).

Trends: There have been increases since 2014 in the percentages of pregnant women who had their blood pressure measured (from 97% to 99%), had a urine sample taken (from 50% to 76%), and had a blood sample taken (from 79% to 88%).

Figure 9.2 Components of antenatal care

9.2.1 Food or Cash Assistance, Deworming, and Iron-containing Supplementation during Pregnancy

Food and cash assistance programs provide assistance to pregnant and lactating women to support healthy diets and address malnutrition.

During pregnancy, women have higher micronutrient needs and are at risk of micronutrient deficiencies, including iron deficiency, which is a primary cause of anemia. Severe anemia can place the mother and the baby in danger through increased risk of blood loss during labor and increased risk of preterm delivery, low birth weight, and perinatal mortality (Haider et al. 2013). To help address maternal anemia, interventions provide iron tablets or syrup (and/or iron-containing multiple micronutrient supplements) to pregnant women (WHO 2016a).

Only 16% of women who had a live birth or stillbirth in the 2 years before the survey reported that they received food or cash assistance during pregnancy to support healthy diets and address malnutrition.

Overall, 98% of women took iron tablets or syrup, while 84% took intestinal parasite medications (**Table 9.4**). Nearly 9 in 10 women (88%) took iron supplements for 90–179 days during pregnancy.

9.2.2 Source of Iron-containing Supplements

Information on sources of iron-containing supplements can increase understanding of the distribution patterns of supplements.

Among women age 15–49 who had a live birth and/or stillbirth in the 2 years preceding the survey and were given or bought iron-containing supplements during the pregnancy of the most recent live birth or stillbirth, 91% obtained supplements from the public sector, primarily health centers (85%), and 9% obtained them from the private medical sector (**Table 9.5**).

9.3 PROTECTION AGAINST NEONATAL TETANUS

Protection against neonatal tetanus

The number of tetanus toxoid injections needed to protect a baby from neonatal tetanus depends on the mother's vaccinations. A birth is protected against neonatal tetanus if the mother has received any of the following:

- Two tetanus toxoid injections during the pregnancy
- Two or more injections, the last one within 3 years of the birth
- Three or more injections, the last one within 5 years of the birth
- Four or more injections, the last one within 10 years of the birth
- Five or more injections at any time prior to the birth

Sample: Women age 15–49 with a live birth in the 2 years before the survey

Neonatal tetanus is a serious problem in areas where home deliveries without sterile procedures are common. It can also be a serious problem in areas with poor immunization coverage and unsafe childbirth and cord care practices. Tetanus injections are given to the mother to prevent neonatal tetanus. Overall, 92% of women received a sufficient number of tetanus toxoid injections to protect their most recent live birth against neonatal tetanus; however, only 67% of mothers received two or more injections during the pregnancy for their last live birth (**Table 9.6**).

Trends: The percentage of births protected against neonatal tetanus increased from 89% in 2014 to 92% in 2021–22.

Patterns by background characteristics

- The percentage of women whose last birth was protected from neonatal tetanus is higher in urban areas (93%) than in rural areas (90%) (**Table 9.6**).
- By province, the percentage of women whose last birth was protected from tetanus ranges from 72% in Ratanak Kiri to 97% in Kampong Chhnang.
- The percentage of women whose last birth was protected from tetanus increases with increasing education, from 84% among those with no education to 98% among those with more than a secondary education.

9.4 DELIVERY SERVICES

9.4.1 Institutional Deliveries

Institutional deliveries

Deliveries that occur in a health facility.

Sample: All live births and/or stillbirths in the 2 years before the survey

Institutional deliveries increase the chances of skilled birth attendance, as well as increasing mothers' access to essential equipment and supplies. Overall, 98% of live births and stillbirths in the 2 years preceding the survey were delivered in a health facility (**Table 9.7**).

Trends: Health facility deliveries increased from 89% in 2014 to 98% in 2021–22, while home deliveries fell from 11% to 2% (**Figure 9.3**).

Patterns by background characteristics

- The lower the birth order, the more likely a baby was delivered in a health facility; 99% of first-order births were delivered in a health facility, as compared with 93% of sixth- or higher-order births.
- Women in urban areas are more likely to deliver in a health facility (99%) than women in rural areas (97%).
- The percentage of women whose last birth was delivered in a health facility increases with increasing education, from 92% among those with no education to 100% among those with more than a secondary education (**Figure 9.4**).

9.4.2 Delivery by Cesarean

Cesarean section (C-section) deliveries can reduce maternal and neonatal mortality. C-section is a surgical intervention to prevent or treat life-threatening maternal or perinatal complications. While most C-sections are performed due to medical or obstetrical indications, some women may request them in the absence of

Figure 9.3 Trends in place of birth

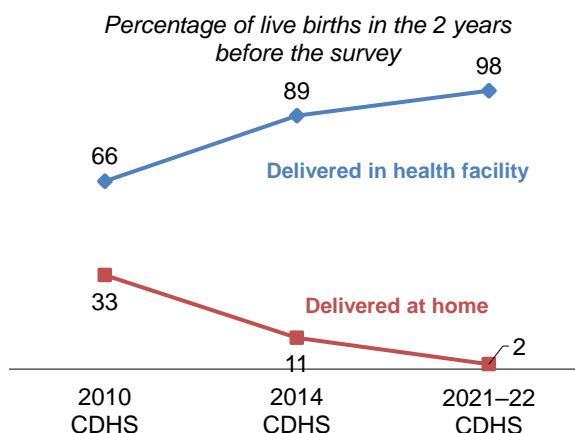

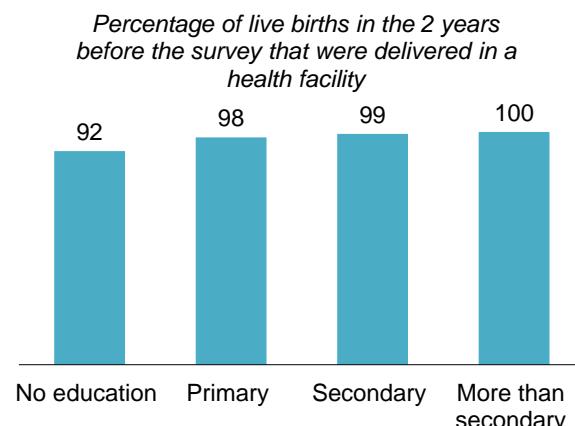

Figure 9.4 Health facility births by mother's education

such signs. Eighteen percent of live births in the 2 years preceding the survey were delivered via C-section (**Table 9.8**).

Trends: The C-section rate increased from 8% in 2014 to 18% in 2021–22.

Patterns by background characteristics

- C-section deliveries decrease with increasing birth order, from 20% among first-order births to 8% among sixth- and higher-order births.
- C-sections are more common in non-NGO private medical sector facilities (50%) than in public health facilities (10%).
- By residence, C-sections are more common in urban areas (24%) than rural areas (14%).
- Among the provinces, cesarean section rates range from a low of 2% in Ratanak Kiri to a high of 29% in Phnom Penh.
- Cesarean section deliveries are less common among births to women with no education (10%) than among those to women with more than a secondary education (36%).
- The percentage of births delivered via C-section increases with increasing household wealth, from 9% in the lowest wealth quintile to 34% in the highest quintile (**Figure 9.5**).

9.4.3 Skilled Assistance during Delivery

Skilled assistance during delivery

Births delivered with the assistance of doctors, nurses/midwives, and auxiliary midwives.

Sample: All live births and/or stillbirths in the 2 years before the survey

Obstetric care from a health professional during delivery is recognized as a critical element in managing complications that may arise during childbirth and reducing maternal and neonatal mortality. In the 2 years preceding the survey, 99% of births were delivered by a skilled provider. Sixty-eight percent of births were delivered by a nurse or midwife, 2% by an auxiliary midwife, and 29% by a doctor (**Table 9.9** and **Figure 9.6**). Seventy-seven percent of babies had skin-to-skin contact immediately after birth.

Trends: The percentage of births with skilled assistance during delivery increased from 93% in 2014 to 99% in 2021–22.

Figure 9.5 Cesarean sections by household wealth

Percentage of live births in the 2 years before the survey that were delivered by cesarean section

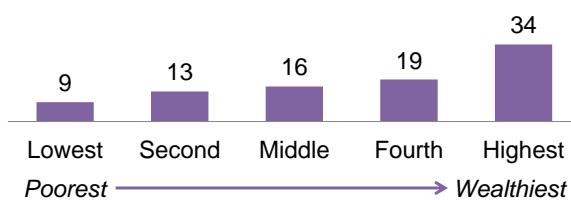

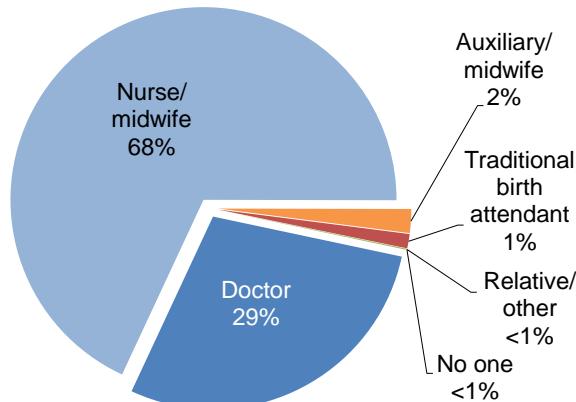

Figure 9.6 Assistance during delivery

Percent distribution of births in the 2 years before the survey

Patterns by background characteristics

- The percentage of deliveries attended by a skilled provider decreases with increasing birth order, from 99% among first-order and second- or third-order births to 93% among sixth- or higher-order births (**Table 9.9** and **Figure 9.7**).
- Births delivered somewhere other than a health facility are much less likely (42%) to be attended by a skilled provider than births delivered in a health facility (100%).
- The higher a woman's educational level, the more likely she is to be assisted by a skilled provider during delivery, from 93% among women with no education to 100% among women with more than secondary education.
- Women in the highest wealth quintile are more likely (100%) to be assisted by a skilled provider during delivery than those in the lowest quintile (95%).

Duration of Stay at Health Facility

Fifty-four percent of women with a vaginal delivery in the 2 years preceding the survey stayed at the health facility 1–2 days after their deliveries, while 37% stayed 3 days or longer. In contrast, 85% of women with a cesarean delivery stayed 3 days or longer after their deliveries (**Table 9.10**).

9.5 POSTNATAL CARE

9.5.1 Postnatal Health Check for Mothers

The postpartum period is particularly important for women, as during this period they may develop serious, life-threatening complications such as postpartum hemorrhage. A postnatal care visit is an ideal time to educate a new mother about how to care for herself and her newborn and can help reduce mortality and morbidity among mothers and their babies.

In Cambodia, 85% of mothers received a postnatal check within the first 2 days after birth (**Table 9.11** and **Figure 9.8**). Sixty percent of mothers had their first postnatal check within 4 hours, 9% had a check between 4 and 23 hours after delivery, and 16% had a check between 1 and 2 days. Only 9% of mothers did not have a postnatal health check.

Trends: The percentage of mothers who received a postnatal check during the first 2 days after their most recent birth decreased from 90% in 2014 to 85% in 2021–22.

Patterns by background characteristics

- Women who deliver in a health facility are more likely to receive their first postnatal check within 2 days of delivery (86%) than those who deliver elsewhere (38%).

Figure 9.7 Skilled assistance at delivery by birth order

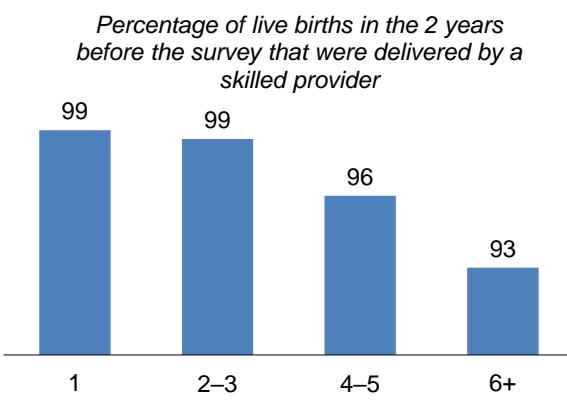

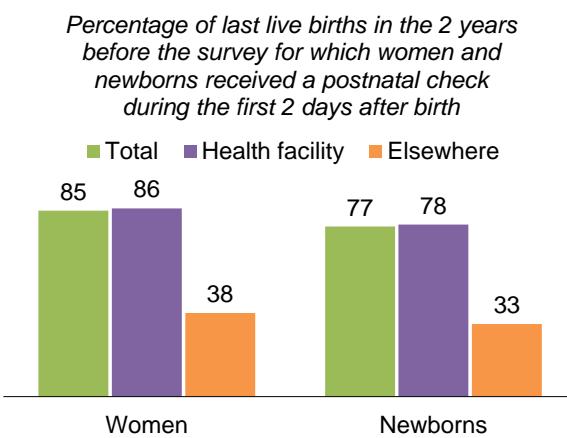

Figure 9.8 Postnatal care by place of delivery

- Urban women are more likely to receive a postnatal check within 2 days of delivery (88%) than rural women (82%).
- By province, the percentage of women receiving a postnatal check within 2 days of delivery is highest in Kampong Chhnang (99%) and lowest in Siemreap (43%).

Type of Provider

The skill level of the provider who performs the first postnatal check also has important implications for maternal and neonatal health. Eighty-one percent of women who had a live birth in the 2 years preceding the survey received their first postnatal health check during the first 2 days after delivery from a doctor or nurse/midwife, 3% received a postnatal check from an auxiliary midwife, and 16% received no postnatal check during the first 2 days after birth (**Table 9.12**).

Content of Care

Table 9.13 presents information on components of postnatal care for the mother within 2 days after birth. Seventy-seven percent each of women had their blood pressure measured and were asked about vaginal bleeding, 57% were asked about family planning, 73% were asked whether they were able to urinate, and 75% were asked whether they had any pain. Overall, 47% of women received all five checks in the first 2 days after birth.

9.5.2 Postnatal Health Check for Newborns

The probability of neonatal death is particularly high during the first 48 hours after birth, making postnatal checks in this period particularly important. Seventy-seven percent of newborns in Cambodia received a postnatal check within 2 days after birth. Five percent received a postnatal check within 1 hour after delivery, and 48% received a check within 1–3 hours after delivery. Nineteen percent of newborns did not receive a postnatal health check (**Table 9.14**).

Patterns by background characteristics

- Newborns delivered in a health facility were much more likely to receive a postnatal health check during the first 2 days after birth than those delivered elsewhere (78% versus 33%) (**Figure 9.8**).
- By province, the percentage of newborns who received a postnatal check within 2 days varies from a low of 34% in Preah Vihear to a high of 97% in Kep.

Type of Provider

About three in four newborns (74%) received a postnatal check within the first 2 days from a doctor or nurse/midwife, while 3% received a check from an auxiliary midwife. Twenty-three percent of newborns did not receive any postnatal check during the first 2 days after birth (**Table 9.15**).

Content of Care

Table 9.16 presents information on components of postnatal care, including five signal functions performed within 2 days after birth. Seventy-five percent of newborns had their umbilical cord examined, 61% had their temperature measured, and 98% were weighed. Postnatal breastfeeding counseling supports exclusive breastfeeding. Face-to-face breastfeeding counseling facilitates observation of positioning and the latch of the infant and allows for tailored breastfeeding counseling and support (WHO 2018). Fifty-six percent of mothers of newborns were counseled on breastfeeding and observed breastfeeding. In addition, 62% were informed about danger signs and how to recognize if their baby needs immediate attention. Nearly half (48%) of newborns had all five signal functions performed within 2 days after birth.

9.5.3 Postnatal Health Checks for Mothers and Newborns

Among all deliveries in the 2 years preceding the survey, 85% of mothers, 77% of newborns, and 74% of both mothers and newborns received a postpartum/postnatal examination within 2 days after birth (**Table 9.17**). In 13% of deliveries, neither the mother nor the newborn received any postnatal check.

9.6 MEN'S INVOLVEMENT IN MATERNAL HEALTH CARE

Table 9.18 presents information on men's involvement in maternal health care. Among men age 15–49 with a child age 0–2, 93% reported that the youngest child's mother had an antenatal check-up during the pregnancy in the 2 years preceding the survey. Among men who reported that the mother of their youngest child had an antenatal check-up, 95% were present during any antenatal visit. Ninety-four percent of men reported that their child was delivered in a health facility. Nearly all men (97%) who reported that their youngest child was delivered in a health facility were with the child's mother during the delivery.

9.7 BREAST AND CERVICAL CANCER EXAMINATIONS

Breast cancer examination

Women were asked if a doctor or other health care provider examined their breasts to check for cancer. The examination could include either a clinical breast exam, in which health care providers use their hands to feel for lumps or other changes, or use of medical equipment to make an image of the breast tissue, such as a mammogram.

Cervical cancer examination

To be checked for cervical cancer, a woman is asked to lie on her back with her legs apart. Then the health care worker uses a brush or swab to collect a sample from inside her. The sample is sent to a laboratory for testing. This test is called a Pap smear or human papillomavirus (HPV) test. Another method is visual inspection with acetic acid (VIA). In this test, the health care worker puts vinegar on the cervix to see if there is a reaction. Women were asked if a doctor or other health care provider ever tested them for cervical cancer. Information on the type of screening test was not collected.

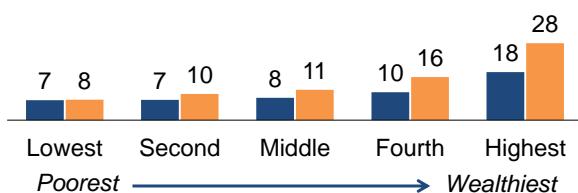

Sample: Women age 15–49

Only 11% of women age 15–49 reported that they had ever been examined by a doctor or other health care provider to check for breast cancer, and 15% reported that they had been tested for cervical cancer (**Table 9.19**). The percentage of women who have received breast and cervical cancer examinations generally increases with increasing education and household wealth (**Table 9.19** and **Figure 9.9**).

Figure 9.9 Breast and cervical cancer exams by household wealth

Percentage of women age 15–49 who were ever examined by a healthcare worker for:

■ Breast cancer ■ Cervical cancer

9.8 PROBLEMS IN ACCESSING HEALTH CARE

Problems in accessing health care

Women were asked whether each of the following factors is a big problem in seeking medical advice or treatment for themselves when they are sick:

- Getting permission to go to the doctor
- Getting money for advice or treatment
- Distance to a health facility
- Not wanting to go alone

Sample: Women age 15–49

Sixty percent of women age 15–49 reported at least one problem in accessing health care for themselves (**Table 9.20**). The most frequently mentioned problems in accessing health care were getting money for advice or treatment (51%) and not wanting to go alone (35%). Women in rural areas were more likely to report at least one problem in accessing health care (68%) than women in urban areas (50%).

9.9 DISTANCE AND MEANS OF TRANSPORT TO THE NEAREST HEALTH FACILITY

About four in every five women reported that it takes them less than 30 minutes to travel to the nearest health facility, and 16% said that they need between 30 minutes and 1 hour to do so (**Table 9.21**). Nearly all women (94%) travel to their nearest health facility using a motorized vehicle such as a car/truck, a public bus, a motorcycle/scooter, or a boat with a motor.

LIST OF TABLES

For more information on maternal and newborn health care, see the following tables:

Note: If more than one source of ANC was mentioned, only the provider with the highest qualifications is considered in this tabulation. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ Skilled provider includes doctor, nurse/midwife, and auxiliary midwife.

² Birth order refers to the order of the birth among the respondent's live births.

³ For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

Table 9.2 Number of antenatal care visits and timing of first visit

Percent distribution of women age 15–49 who had a live birth and/or a stillbirth in the 2 years preceding the survey by number of antenatal care (ANC) visits during pregnancy for the most recent live birth or stillbirth and by the timing of the first visit, and among women with ANC, median months pregnant at first visit, according to background characteristics, Cambodia DHS 2021–22

Background characteristic	Number of ANC visits						4+ ANC visits	Number of months pregnant at time of first ANC visit						Number of women	Median months pregnant at first visit (for those with ANC)	Number of women with ANC	
	None	1	2–3	4–7	8+	Don't know		Total	No ante-natal care	<4	4–6	7+	Total

Note: The denominator for this table includes all women with a birth in the 2 years preceding the survey who received ANC for that birth. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ Birth order refers to the order of the birth among the respondent's live births.

² For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

Table 9.3.2 Components of antenatal care among all women

Among all women age 15–49 with a live birth and/or stillbirth in the 2 years preceding the survey, percentage receiving specific antenatal services from a health care provider for their most recent live birth and/or stillbirth, according to background characteristics, Cambodia DHS 2021–22

Background characteristic	Percentage who received specific services during ANC from a health care provider for their most recent live birth or stillbirth:										Number of women with a live birth and/or stillbirth in the last 2 years
	Blood pressure measured	Urine sample taken	Blood sample taken	Baby's heartbeat checked	C counseled about maternal diet	C counseled about breast-feeding	A asked about vaginal bleeding	C counseled about stopping smoking, drinking, or using drugs	W weight measured	T talked with about when the baby is due or will arrive	T told to pay attention to the baby's movements

LIVE BIRTHS AND STILLBIRTHS⁴											
Total	28.6	68.1	2.0	1.2	0.1	0.0	100.0	98.7	3,332	na	na

Note: If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this tabulation. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

NGO = Nongovernmental organization

na = not applicable

¹ Skilled provider includes doctor, nurse/midwife, and auxiliary midwife.

² Birth order refers to the order of the birth among the respondent's live births.

³ Includes only the most recent birth in the 2 years preceding the survey

⁴ For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data are tabulated for the most recent birth only.

Table 9.10 Duration of stay in health facility after birth

Among women with a live birth and/or stillbirth in the 2 years preceding the survey who delivered their most recent live birth in a health facility, percent distribution by duration of stay in the health facility following their most recent live birth, according to type of delivery, Cambodia DHS 2021–22

Type of delivery	<6 hours	6–11 hours	12–23 hours	1–2 days	3+ days	Missing	Total	Number of women
LIVE BIRTHS								
Vaginal birth	6.7	1.7	0.5	53.8	37.2	0.2	100.0	2,601
Cesarean section	4.5	0.8	0.0	9.2	84.8	0.6	100.0	583

¹ Captures newborns who were weighed "at birth." May exclude some newborns who were weighed during the 2 days after birth.

² The functions are (1) examining the umbilical cord, (2) measuring temperature, (3) observing and counseling on breastfeeding, (4) telling the mother about danger signs/how to recognize if the baby needs immediate attention, and (5) weighing. Corresponds to the definition of the five signal functions to assess the content of postnatal care for newborns described in Moran et al. 2013.

³ Birth order refers to the order of the birth among the respondent's live births.

Table 9.17 Postnatal checks for mothers and newborns

Among most recent live births in the 2 years preceding the survey, percentage for whom mothers age 15–49 received a postnatal check during the first 2 days after birth, percentage for whom newborns received a postnatal check during the first 2 days after birth, percentage for whom both mothers and newborns received a postnatal check, and percentage for whom neither mothers nor newborns received a postnatal check, according to background characteristics, Cambodia DHS 2021–22

² Includes animal-drawn cart, bicycle, boat without motor, and walking

Key Findings

- **Vaccinations:** 76% of children age 12–23 months had received all basic vaccinations by the time of the survey, and 65% were fully vaccinated according to national schedule.
- **Symptoms of acute respiratory infection (ARI):** 1% of children under age 5 had symptoms of ARI in the 2 weeks before the survey. Advice or treatment was sought for 92% of children with symptoms of ARI.
- **Fever:** Advice or treatment was sought for 80% of children under age 5 who had a fever in the 2 weeks before the survey.
- **Diarrhea:** 6% of children under age 5 had diarrhea in the 2 weeks before the survey, and advice or treatment was sought for 69% of these children. Fifty-three percent of children with diarrhea received oral rehydration therapy (ORT), while 17% received no treatment.

Information on child health and survival can help policymakers and program managers assess the efficacy of current strategies, formulate appropriate interventions to prevent deaths from childhood illnesses, and improve the health of children in Cambodia.

This chapter presents information on birth weight and vaccination status for young children. It also looks at the prevalence of, and care-seeking behaviors for, three common childhood illnesses: symptoms of acute respiratory infection (ARI), fever, and diarrhea.

10.1 CHILD'S SIZE AND BIRTH WEIGHT

Low birth weight

Percentage of births with a reported birth weight <2.5 kilograms regardless of gestational age

Sample: Live births in the 2 years before the survey that have a reported birth weight, from either a written record or the mother's report

Birth weight is one of the major determinants of infant and child health and mortality. Children whose birth weight is less than 2.5 kilograms, or children reported to be “very small” or “smaller than average,” are considered to have a higher than average risk of early childhood death. For births in the 2 years preceding the 2021–22 CDHS, birth weight was recorded in the questionnaire if available from either a written record or the mother’s recall. Because birth weight may not be known for some babies, the mother’s estimate of the baby’s size at birth was also obtained.

Table 10.1 shows that 98% of births have a reported birth weight. Among those births for which the mother was able to report the baby’s weight, 6% were classified as low birth weight (less than 2.5 kilograms at birth).

Table 10.1 also includes information on the mother’s assessment of the baby’s size at birth. In the absence of birth weight, a mother’s subjective assessment of the size of the baby at birth may be useful. However,

this assessment may vary among respondents because it is based on the mother's own perception of what is small, average, or large for a baby and not on a uniform definition. Ninety-three percent of infants were considered by their mothers to be average or larger than average in size, 6% were perceived as smaller than average, and 1% were considered very small.

10.2 VACCINATION OF CHILDREN

Universal immunization of children against common vaccine-preventable diseases is crucial to reducing infant and child morbidity and mortality. In Cambodia, routine childhood vaccines include bacillus Calmette-Guérin (BCG) (tuberculosis), HepB (hepatitis B), oral polio vaccine (OPV) or inactivated polio vaccine (IPV), pentavalent or DPT-HepB-Hib (diphtheria, pertussis, tetanus, hepatitis B, and *Haemophilus influenzae* type b), pneumococcal conjugate vaccine (PCV), and measles-rubella (MR).

Information on vaccination coverage was obtained in two ways in the 2021–22 CDHS: from written vaccination records, including vaccination or health cards, and from verbal reports. For each child born in the 3 years before the survey, mothers were asked to show the interviewer the vaccination card or other document used for recording the child's immunizations. If the vaccination card or other document was available, the interviewer copied the dates of each vaccination received. If a vaccination was not recorded on the vaccination card or document as having been administered, the mother was asked to recall whether that particular vaccination had been given. If the mother was not able to present the vaccination card or other document for a child, she was asked to recall whether the child had received the BCG, hepatitis B birth dose, polio, DPT-HepB-Hib, pneumococcal, and measles-rubella vaccines. If she indicated that the child had received any of the multidose vaccines, she was asked the number of doses the child received.

10.2.1 Vaccination Card Ownership and Availability

Vaccination cards are a critical tool in ensuring that a child receives all recommended vaccinations on schedule. Among children age 12–23 months and age 24–35 months, 98% and 97%, respectively, ever had a vaccination card or other document on which their vaccinations were recorded (**Table 10.2**). However, not all mothers were able to produce their child's vaccination card at the time of the interview. Eighty-two percent of children age 12–23 months and 73% of children age 24–35 months had vaccination cards available at the time of the interview. **Table 10.2** also provides information on vaccination card ownership and availability by background characteristics.

10.2.2 Basic Antigen Coverage

Fully vaccinated: basic antigens

Percentage of children who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report). To have received all basic antigens, a child must receive at least:

- One dose of BCG vaccine, which protects against tuberculosis
- Three doses of polio vaccine given as oral polio vaccine (OPV), inactivated polio vaccine (IPV), or a combination of OPV and IPV
- Three doses of DPT-containing vaccine, which protects against diphtheria, pertussis (whooping cough), and tetanus, given as DPT-HepB-Hib
- One dose of measles-containing vaccine given as measles-rubella (MR)

Sample: Children age 12–23 months and age 24–35 months

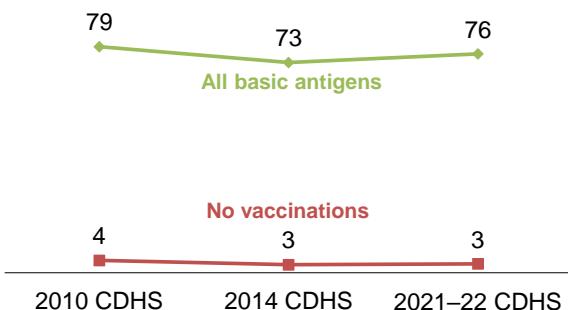

Historically, an important measure of vaccination coverage has been the proportion of children receiving all “basic” antigens. Children are considered fully vaccinated against all basic antigens if they have received the BCG vaccine, three doses each of polio vaccine and DPT-containing vaccine, and a single dose of measles-containing vaccine. In Cambodia, the BCG vaccine is usually given at birth or at first clinic contact, while the polio and DPT-containing vaccines (the latter, given in combination with HepB and Hib as DPT-HepB-Hib) are given at approximately age 6, 10, and 14 weeks. A first measles-containing vaccine (given as measles-rubella) should be given at or soon after age 9 months.

Seventy-six percent of children age 12–23 months and 78% of children age 24–35 months are fully vaccinated against all basic antigens, with 73% of those age 12–23 months and 72% of those age 24–35 months having received them by age 12 months (**Table 10.3**).

Trends: The percentage of children age 12–23 months who received all basic vaccinations increased slightly between 2014 and 2021–22, from 73% to 76% (**Figure 10.1**). Over the same time period, the percentage receiving no vaccinations has not changed.

Figure 10.1 Trends in childhood vaccinations

Percentage of children age 12–23 months who received all basic antigens at any time before the survey

10.2.3 National Schedule Coverage

Fully vaccinated according to national schedule: age 12–23 months

Percentage of children who received specific vaccines at any time before the survey (according to a vaccination card or the mother’s report). To be fully vaccinated according to the national schedule, a child must receive the following:

- One dose of BCG vaccine: at birth
- Hepatitis B vaccine: at birth
- Three doses of OPV: at 6 weeks, 10 weeks, and 14 weeks after birth
- One dose of IPV: at 14 weeks after birth
- Three doses of DPT-HepB-Hib: at 6 weeks, 10 weeks, and 14 weeks after birth
- Three doses of Pneumococcal conjugate vaccine (PCV): at 6 weeks, 10 weeks, and 14 weeks after birth
- One dose of MR: at 9 months after birth

Sample: Children age 12–23 months

Fully vaccinated according to national schedule: age 24–35 months

Percentage of children who received specific vaccines at any time before the survey (according to a vaccination card or the mother’s report). To be fully vaccinated according to the national schedule, a child must receive all of the vaccinations listed above along with the following:

- A second dose of MR: at 18 months after birth

Sample: Children age 24–35 months

A second measure of vaccination coverage is the percentage of children age 12–23 months and 24–35 months who are fully vaccinated according to the national schedule. In this report, a child age 12–23 months is considered to be fully vaccinated according to the national schedule if the child has received all basic antigens as well as a birth dose of HepB vaccine, a dose of IPV given at the same time as a third dose of OPV, three doses of HepB and Hib (given as part of DPT-HepB-Hib), and three doses of PCV. Children age 24–35 months have received all vaccinations according to the national schedule if they have received a second dose of the MR vaccine in addition to all of the vaccinations relevant for a child age 12–23 months.

In Cambodia, only 65% of children age 12–23 months are fully vaccinated according to the national schedule. This percentage drops to 55% among children age 24–35 months. Sixty-two percent of children age 12–23 months and 49% of those age 24–35 months were fully vaccinated according to the national schedule by age 12 months and by age 24 months, respectively, as recommended.

Figure 10.2 shows coverage of all age-appropriate vaccinations among children age 12–23 months. Ninety-four percent of children age 12–23 months received the BCG and HepB (birth dose) vaccines. In the case of multi-dose vaccines such as OPV, DPT-HepB-Hib, and PCV, coverage is highest for the first dose and falls for subsequent doses. For example, 95% received the first dose of OPV and 86% received the third dose. Because OPV, DPT-HepB-Hib, and PCV vaccines are often administered at the same time, their coverage rates are similar. Seventy-eight percent received a dose of IPV and 83% were vaccinated against measles-rubella. Three percent of children age 12–23 months received no vaccinations.

Patterns by background characteristics

- Urban children age 12–23 months are more likely to be fully vaccinated according to the national schedule than rural children (70% versus 61%) (**Figure 10.3**).
- Children of mothers with no formal education (54%) are less likely to be fully vaccinated than children of mothers with a secondary education and more than a secondary education (65% and 82%, respectively) (**Table 10.4**).
- By province, full vaccination coverage among children age 12–23 months ranges from 24% in Rattanak Kiri to 79% in Battambang (**Map 10.1**).

Figure 10.2 Childhood vaccinations

Percentage of children age 12–23 months vaccinated at any time before the survey

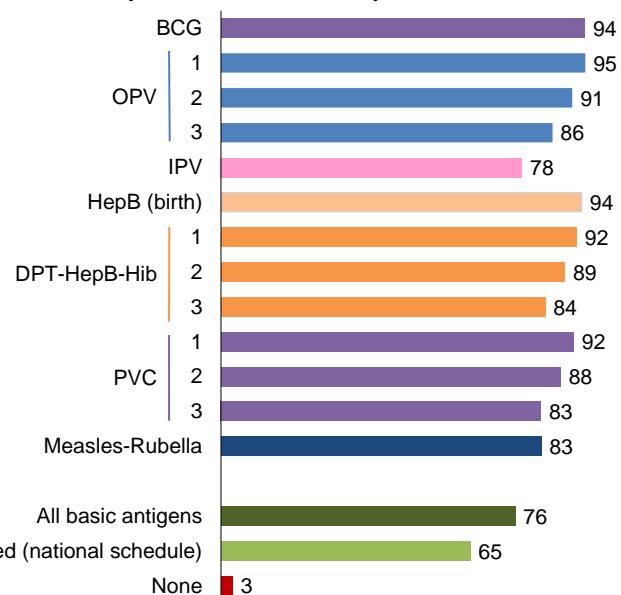

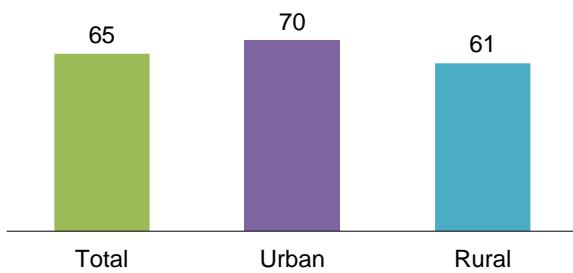

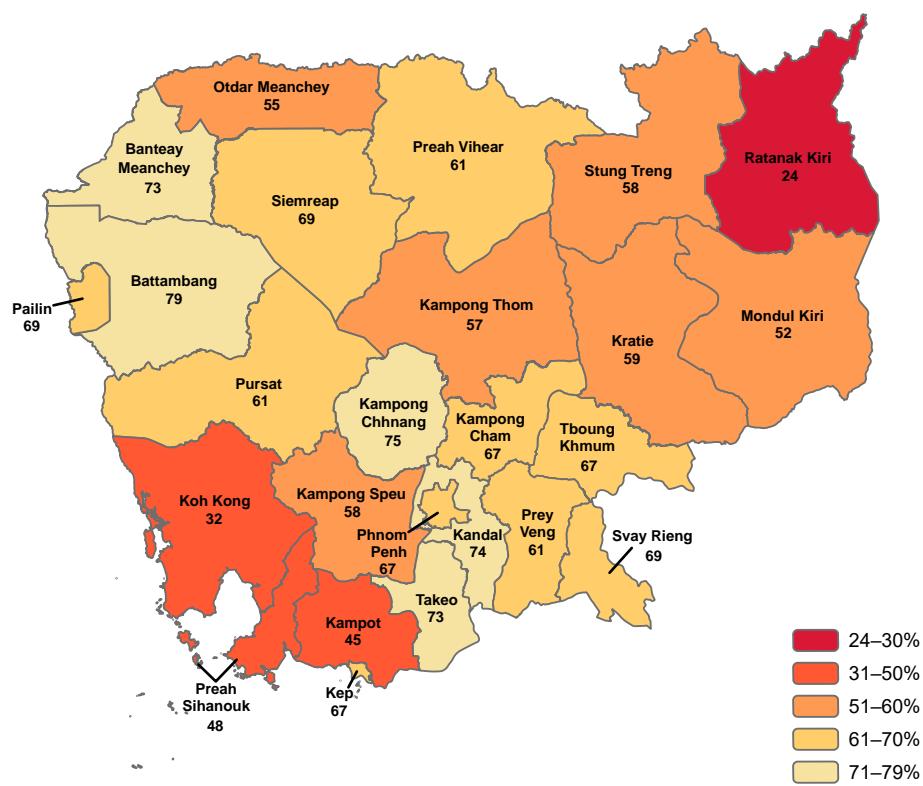

Figure 10.3 Vaccination coverage by residence

Percentage of children age 12–23 months who were fully vaccinated (according to national schedule) at any time before the survey

Map 10.1 Vaccination coverage by province

Percentage of children age 12–23 months who were fully vaccinated according to national schedule at any time before the survey

Source of Vaccinations

Table 10.5 shows that nearly all children age 12–23 months and 24–35 months received vaccinations from public medical sector sources (99% each).

10.3 SYMPTOMS OF ACUTE RESPIRATORY INFECTION (ARI) AND CARE-SEEKING BEHAVIOR

Acute respiratory infection (ARI) is among the leading causes of childhood morbidity and mortality in Cambodia and throughout the world. Pneumonia is the most serious outcome of ARI in young children. Early diagnosis and treatment with antibiotics can prevent a large proportion of deaths caused by pneumonia. Cambodia is engaging in substantial efforts to reduce pneumonia morbidity and mortality. Integrated management of childhood illness (IMCI) has been implemented by the Ministry of Health to address common childhood illnesses. The prevalence of ARI symptoms was estimated by asking mothers whether their children under age 5 had been ill with short or rapid breathing or difficulty breathing that was chest-related in the 2 weeks preceding the survey.

Care seeking for symptoms of acute respiratory infection (ARI)

Children with symptoms of ARI for whom advice or treatment was sought. ARI symptoms consist of short, rapid breathing that is chest-related and/or difficult breathing that is chest-related.

Sample: Children under age 5 with symptoms of ARI in the 2 weeks before the survey

Table 10.6 shows that only 1% of children under age 5 had ARI symptoms in the 2 weeks preceding the survey. Advice or treatment was sought for 92% of children with ARI symptoms, and advice or treatment was sought the same or next day for 59% of these children.

Source of Advice or Treatment for Symptoms of ARI

Among 69% of children with symptoms of ARI, advice or treatment was sought from private medical sector facilities (primarily in the form of private clinics); only 21% were taken to public medical sector facilities (primarily public health centers) for advice or treatment (**Table 10.7**). Among children with symptoms of ARI for whom advice or treatment was sought, 75% were taken to a private medical sector facility and only 23% to a public sector facility.

10.4 FEVER AND CARE-SEEKING BEHAVIOR

Fever is a major manifestation of different acute infections in children in Cambodia and can occur year-round. Delays in diagnosis and treatment of those infections may contribute to high levels of morbidity and mortality in young children.

Care seeking for fever

Children with fever for whom advice or treatment was sought.

Sample: Children under age 5 with a fever in the 2 weeks before the survey

Table 10.8 shows the percentage of children under age 5 with a fever during the 2 weeks preceding the survey and the percentage receiving various treatments, by selected background characteristics. Among children under age 5, 13% had a fever in the 2 weeks preceding the survey. Four in every five children with fever (80%) were taken for advice or treatment. Advice or treatment was sought the same or next day for 66% of children with fever, and 41% were treated with antibiotic drugs (**Table 10.8**).

Trends: The percentage of children with fever for whom advice or treatment was sought declined from 88% in 2014 to 80% in 2021–22.

Source of Advice or Treatment for Fever

Among children with a fever, 59% were taken to private medical sector facilities (mostly private clinics) for advice or treatment, while only 17% were taken to public medical sector facilities (mostly public health centers) (**Table 10.9**). Among children with a fever for whom advice or treatment was sought, 73% were taken to a private medical sector facility and only 21% to a public sector facility.

10.5 DIARRHEAL DISEASE

Diarrheal disease remains an important cause of mortality and morbidity among young children in Cambodia. Oral rehydration therapy (ORT) and supplemental zinc, combined with continued feeding, are the recommended interventions for treating diarrhea. ORT can be provided as increased fluids (especially increased breastfeeding), as fluid prepared from a packet of oral rehydration salts (ORS), or as government-recommended homemade fluids (RHF). Zinc has been shown to reduce the severity and duration of diarrhea, and it is recommended that all children with diarrhea receive a 5-day course of zinc.

10.5.1 Diarrhea and Care-seeking Behavior

Care seeking for diarrhea

Children with diarrhea for whom advice or treatment was sought.

Sample: Children under age 5 with diarrhea in the 2 weeks before the survey

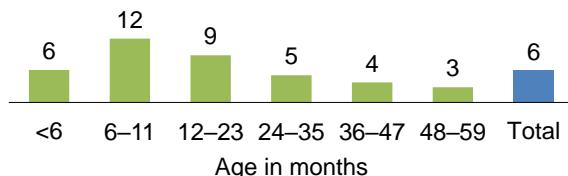

Table 10.10 shows the percentage of children under age 5 with diarrhea during the 2 weeks preceding the survey and the percentage for whom advice or treatment was sought, by selected background characteristics. Among children under age 5, 6% had diarrhea in the 2 weeks preceding the survey. Sixty-nine percent of children with diarrhea were taken for advice or treatment.

Patterns by background characteristics

- Children age 6–11 months were more likely than younger children and older children to have had diarrhea in the 2 weeks preceding the survey (12% versus 3%–9%) (**Figure 10.4**).
- The prevalence of diarrhea is slightly higher in rural areas than in urban areas (7% versus 5%). However, children in urban areas are more likely to be taken to a health facility or provider for advice or treatment than children in rural areas (77% versus 65%).
- Children in households that use surface water as a source of drinking water are more likely to have had diarrhea than children in households that use improved sources of drinking water (10% versus 6%).

Figure 10.4 Diarrhea prevalence by age

Percentage of children under age 5 who had diarrhea in the 2 weeks before the survey

10.5.2 Feeding Practices

Appropriate feeding practices

Children with diarrhea are given more liquids than usual and as much food or more than usual.

Sample: Children under age 5 with diarrhea in the 2 weeks before the survey

To reduce dehydration and minimize the effects of diarrhea on nutritional status, caregivers are encouraged to continue normal feeding or increase feeding of children with diarrhea and to increase the amount of fluids given.

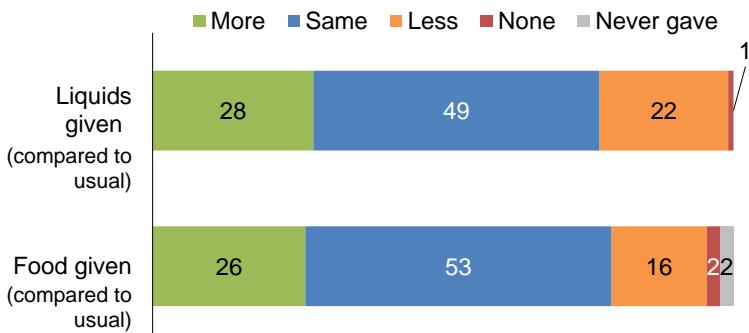

Only 28% of children under age 5 with diarrhea in the 2 weeks before the survey were given more liquids than usual, as recommended. Forty-nine percent were given the same amount of liquids, 22% were given less liquids than usual, and 1% were given no liquids at all.

Nonbreastfeeding children (28%) were slightly more likely than breastfeeding children (25%) to receive more liquid than usual (**Table 10.11**).

Four in five (79%) children with diarrhea were fed according to the recommended practice of giving the same amount of food (53%) or more food (26%). Sixteen percent of children were given less food than usual, while 2% of children received no food at all (**Table 10.11** and **Figure 10.5**).

Figure 10.5 Feeding practices during diarrhea

Percentage of children under age 5 with diarrhea in the 2 weeks before the survey

10.5.3 Oral Rehydration Therapy, Zinc, Continued Feeding, and Other Treatments

Oral rehydration therapy

Children with diarrhea are given increased fluids, a fluid made from a special packet of oral rehydration salts (ORS), or government-recommended homemade fluids (RHF).

Sample: Children under age 5 with diarrhea in the 2 weeks before the survey

Table 10.12 shows that 53% of children under age 5 with diarrhea in the 2 weeks preceding the survey received ORT. Thirteen percent of children with diarrhea were given zinc, 10% received both ORS and zinc, and 9% received ORS, zinc, and continued feeding. Three percent of children received antibiotics, while 49% were given a home remedy or other treatment. Seventeen percent of children received no treatment at all (**Figure 10.6**).

Trends: The percentage of children under age 5 with diarrhea who received zinc increased from 5% in 2014 to 13% in 2021–22. The proportion of children with diarrhea who received no treatment was nearly unchanged (18% in 2014 versus 17% in 2021–22).

Patterns by background characteristics

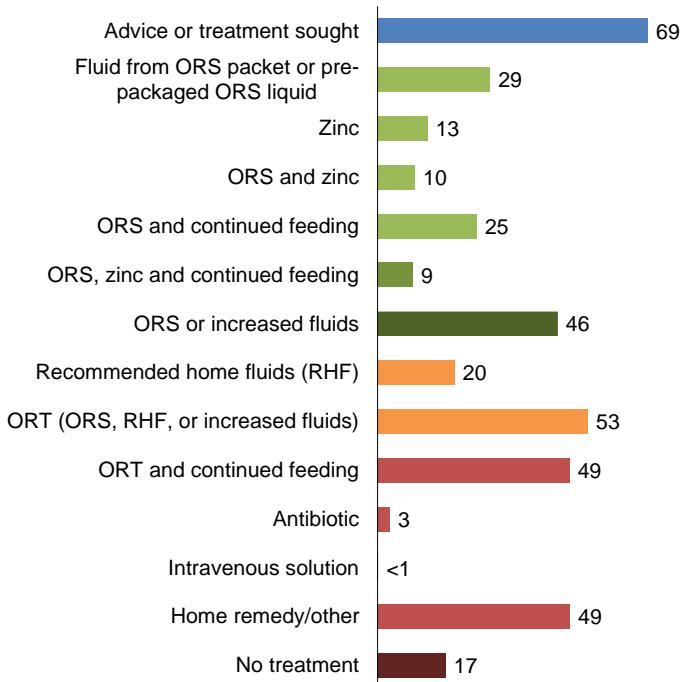

- The proportion of children with diarrhea who received zinc is higher in rural areas (14%) than in urban areas (9%).
- The proportion of children with diarrhea who received ORT is lower among those whose mothers have no formal education (45%) than among those whose mothers have primary education (56%) or secondary education (54%).
- The proportion of children with diarrhea who received ORT does not have a clear association with household wealth.

Source of Advice or Treatment for Diarrhea

Among children with diarrhea for whom advice or treatment was sought, the majority (66%) were taken to a private provider, most commonly a private clinic (30%) or a general care room (18%). About one-quarter (26%) were taken to public medical providers, mostly public health centers (21%) (**Table 10.13**).

Figure 10.6 Treatment of diarrhea

Percentage of children under age 5 with diarrhea in the 2 weeks before the survey

Number of children	1,346	295	1,641	1,641	1,095	399	1,494	1,494

na = not applicable

BCG = Bacillus Calmette-Guérin; DPT = Diphtheria-pertussis-tetanus; HepB = Hepatitis B; Hib = *Haemophilus influenzae* type b; IPV = Inactivated polio vaccine; OPV = Oral polio vaccine

¹ Vaccination card, booklet, or other home-based record

² Received by age 12 months

³ For children whose vaccination information is based on the mother's report, date of vaccination is not collected. The proportions of vaccinations given during the first and second years of life are assumed to be the same as for children with a written record of vaccination.

⁴ Received by age 12 months for all vaccines except measles-rubella 2, which should be received by age 24 months

⁵ Children are considered to have received HepB (birth dose) if it was recorded on their card or reported by their mother, regardless of timing.

⁶ BCG, three doses of DPT-containing vaccine, three doses of polio vaccine, and one dose of measles-rubella

⁷ For children age 12–23 months: BCG, HepB (birth dose), three doses of DPT-containing vaccine, three doses of OPV, one dose of IPV, three doses of pneumococcal vaccine, and one dose of measles-rubella vaccine. For children age 24–35 months: BCG, HepB (birth dose), three doses of DPT-containing vaccine, three doses of OPV, one dose of IPV, three doses of pneumococcal vaccine, and two doses of measles-rubella vaccine.

Table 10.4 Vaccinations by background characteristics

Percentage of children age 12–23 months and children age 24–35 months who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report), percentage fully vaccinated (basic antigens), percentage fully vaccinated according to national schedule, and percentage who received no vaccinations, according to background characteristics, Cambodia DHS 2021–22

Key Findings

- **Nutritional status of children:** 22% of children under age 5 are stunted, 10% are wasted, 16% are underweight, and 4% are overweight.
- **Breastfeeding:** Among children age 0–23 months, 54% were breastfed within 1 hour of birth and 50% were exclusively breastfed for the first 2 days after birth; 50% of children under age 6 months are exclusively breastfed.
- **Complementary feeding:** 49% of children age 6–23 months received meals with the minimum recommended diversity the previous day, 82% received meals at the minimum frequency, 42% were fed a minimum acceptable diet, 28% were given sweet beverages, and 21% were given unhealthy foods.
- **Coverage of iron-containing supplementation, vitamin A, and deworming:** During the 12 months before the survey, 15% of children age 6–59 months were given iron-containing supplements. During the 6 months before the survey, 40% of children age 6–59 months were given vitamin A supplements and 47% of children age 12–59 months were given deworming medication.
- **Nutritional status of women:** 4% of women age 20–49 and 14% of young women age 15–19 are of short stature. In addition, 7% of women age 20–49 and 29% of women age 15–19 are thin. The prevalence of overweight or obesity is 33% among women age 20–49 and 6% among women age 15–19.
- **Women's dietary practices:** 57% of women consumed food from at least five of 10 specified food groups (minimum dietary diversity) the previous day, 63% consumed sweet beverages, and 33% consumed unhealthy foods.
- **Salt iodization:** 49% of households have iodized salt.

Nutrition is the foundation for the health and development of children and adults. This chapter reports on nutritional status among children and adults, infant and young child feeding (IYCF) practices, and women's dietary practices. In addition, the chapter presents data on key nutrition interventions including infant and young child feeding counseling, child growth monitoring, micronutrient supplementation, deworming for children, and the presence of iodine in household cooking salt. Chapter 9 presents information on nutritional interventions provided during the antenatal period such as maternal nutrition counseling, breastfeeding counseling, food or cash assistance, deworming, iron-containing

supplementation and sources of the supplements, and postnatal breastfeeding counseling and observation. Chapter 10 presents information on child feeding practices during diarrhea.

11.1 NUTRITIONAL STATUS OF CHILDREN

Anthropometry is commonly used to measure child nutritional status. The anthropometric measurements are used to report on child growth indicators. The distribution of height and weight among children under age 5 was compared with the WHO Child Growth Standards reference population (WHO 2006). The distribution of a well-nourished population will be similar to that of the reference population, while the distribution of a poorly nourished population will not. The indices height-for-age, weight-for-height, and weight-for-age can be expressed in standard deviation units (z scores) from the median of the reference population. Values that are greater than two standard deviations below the median of the WHO Child Growth Standards are used to define malnutrition.

Stunting, or low height-for-age, is a measure of growth faltering. Stunting is a marker of children's exposure to a deficient growth environment and reflects the overall well-being of a population (Perumal et al. 2018). Suboptimal nutrition can contribute to stunting, while other causes include recurrent infection and chronic diseases; many of the causes of stunting are complex and unknown (WHO 2014a).

Wasting, or low weight-for-height, is a measure of acute undernutrition. It represents the failure to receive adequate nutrition in the period immediately before the survey. Wasting may result from inadequate food intake or from a recent episode of illness or infection that results in weight loss.

Underweight, or low weight-for-age, is a composite index of weight-for-height and height-for-age. It reflects children who are stunted, wasted, or both.

Overweight, or high weight-for-height, results from an imbalance between energy consumed (too much) and energy expended (too little).

Stunting (assessed via height-for-age)

Height-for-age is a measure of growth faltering. Children whose height-for-age z score is below minus two standard deviations (-2 SD) from the median of the reference population are considered short for their age (stunted). Children whose z score is below minus three standard deviations (-3 SD) from the median are considered severely stunted.

Sample: Children under age 5

Wasting (assessed via weight-for-height)

The weight-for-height index measures body mass in relation to body height or length and describes acute undernutrition. Children whose z score is below minus two standard deviations (-2 SD) from the median of the reference population are considered thin (wasted). Children whose z score is below minus three standard deviations (-3 SD) from the median are considered severely wasted.

Sample: Children under age 5

Underweight (assessed via weight-for-age)

Weight-for-age is a composite index of height-for-age and weight-for-height that takes into account both wasting and stunting. Children whose weight-for-age z score is below minus two standard deviations (-2 SD) from the median of the reference population are classified as underweight. Children whose z score is below minus three standard deviations (-3 SD) from the median are considered severely underweight.

Sample: Children under age 5

Overweight (assessed via weight-for-height)

Children whose weight-for-height z score is more than two standard deviations ($+2\text{ SD}$) above the median of the reference population are considered overweight.

Sample: Children under age 5

The means of the z scores for height-for-age, weight-for-height, and weight-for-age are also calculated as summary statistics that represent the nutritional status of children in a population. The mean scores describe the nutritional status of the entire population of children without the use of a cutoff point. A mean z score of less than 0 (a negative mean value for stunting, wasting, or underweight) suggests a downward shift in the entire sample population's nutritional status relative to the reference population. The farther away mean z scores are from 0, the higher the prevalence of malnutrition.

Child Growth Measures of Malnutrition

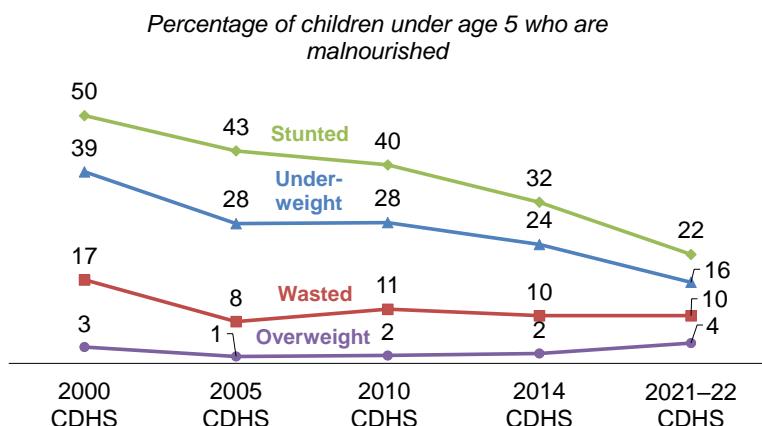

Information on anthropometry training, standardization, and data collection methodology can be found in Chapter 1. The 2021–22 CDHS identified a total of 4,443 children under age 5 who were eligible for height and weight measurements (**Appendix Table C.8**). During measurements, 1% of children had hairstyles or ornamentation that interfered with height measurement, and 5% of children were not minimally dressed or wore heavy permanent ornaments that interfered with weight measurement (**Appendix Table C.10**). Valid height-for-age measurements were obtained for 95% of eligible children, valid weight-for-height measurements were obtained for 96% of eligible children, and valid weight-for-age measurements were obtained for 98% of eligible children (**Appendix Table C.8**). **Appendix Table C.8** provides additional information on the completeness and quality of anthropometry data for children.

Data collection included remeasurement of children as described in Chapter 1. The calculation of final z scores was based on the first measurement among children randomly selected for remeasurement, while the calculation of final z scores was based on the second measurement among children flagged for remeasurement. Remeasurement completion rates were 100% among both those randomly selected and those flagged for remeasurement. **Appendix Table C.9** provides additional information on remeasurement data (WHO 2019).

Overall, 22% of Cambodian children under age 5 are stunted, with 6% being severely stunted; 10% are wasted, with 2% severely wasted; and 16% are underweight, with 3% severely underweight. The prevalence of overweight among children is 4% (**Table 11.1**).

Trends: **Figure 11.1** shows that there have been improvements in nutritional status of children in the last 22 years. The percentage of stunted children fell consistently from 50% in 2000 to 22% in 2021–22. The percentage of children wasted declined from 17% in 2000 to 8% in 2005, increased to 11% in 2010, and remained unchanged at 10% in 2014 and 2021–22. Underweight declined from 39% in 2000 to 16% in 2021–22.

Figure 11.1 Trends in child growth measures

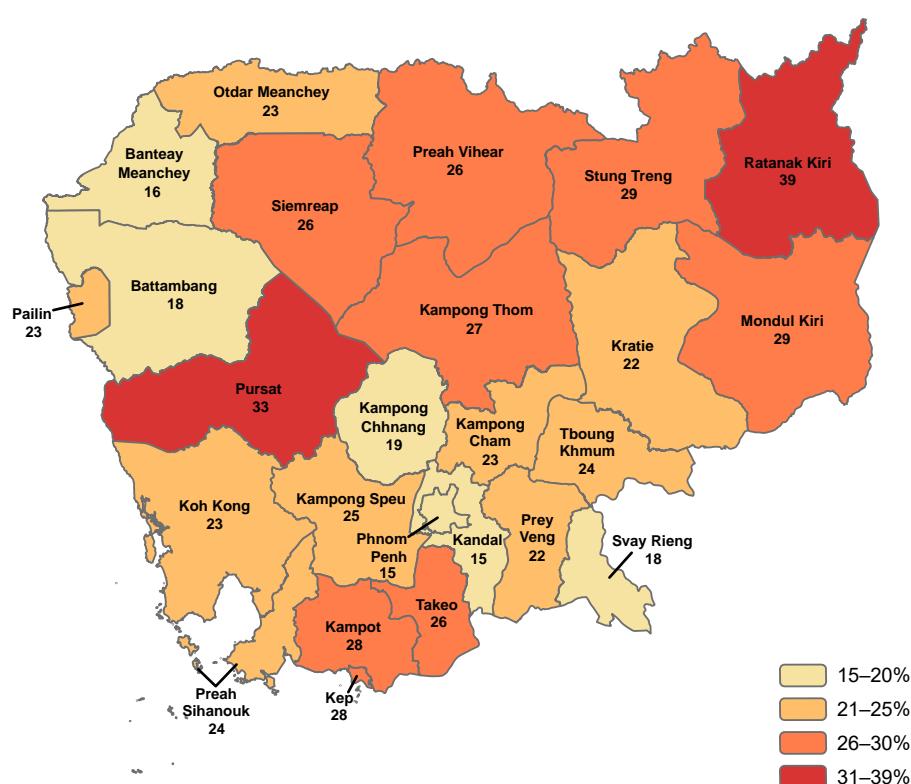

Patterns by background characteristics

- The prevalence of stunting and underweight is higher among boys (25% and 18%, respectively) than girls (19% and 15%, respectively).
- Among children reported to be small at birth, 37% are stunted and 28% are underweight. In contrast, among children reported to be average or larger at birth, 20% are stunted and 14% are underweight. The prevalence of wasting is similar among children born smaller and those born average or larger (12% and 10%), while the prevalence of overweight is higher among children born average or larger than children born smaller (5% versus 2%).
- Thirty percent of children whose mothers are thin are stunted, 29% are underweight, and 20% are wasted.
- The percentage of children who are undernourished is lower among those whose mothers have more than a secondary education than among those whose mothers have no education (17% versus 28% for stunting, 6% versus 17% for wasting, and 7% versus 29% for underweight). Conversely, the percentage of children who are overweight is higher among those whose mothers have more than a secondary education among those whose mothers have no education (7% versus 3%).
- The prevalence of stunting is highest among children in Ratanak Kiri (39%) and lowest among children in Phnom Penh and Kandal (15% each) (**Map 11.1**).¹

Map 11.1 Stunting in children by province

Percentage of children under age 5 who are stunted

¹ COVID-19 restrictions prevented training practice with children and standardization. Subnational estimates should be interpreted with caution for Kampong Chhnang, Kampong Speu, Kampong Thom, Kampot, Koh Kong, Pursat, Ratanak Kiri, Siemreap, Svay Rieng, Takeo, Kep, and Tboung Khmum.

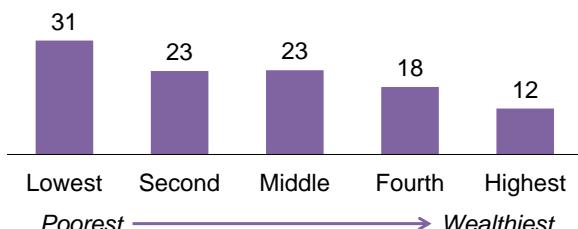

- The percentage of children who are stunted and underweight is higher in rural areas (25% and 19%, respectively) than in urban areas (17% and 12%, respectively). The opposite is true for the percentage of children who are overweight (6% in urban areas and 3% in rural areas).
- The percentage of children who are stunted declines with increasing wealth, from 31% in the lowest wealth quintile to 12% in the highest wealth quintile (**Figure 11.2**).

11.2 GROWTH MONITORING AND PROMOTION

Growth monitoring and promotion programs include monitoring children's nutritional status through physical growth measurements and using this information to provide caregivers with counseling and referrals of children whose growth appears abnormal (WHO 2013; WHO 2017a). An important component of growth monitoring is regular measurement of children's weight, length/height, and/or mid-upper-arm circumference (MUAC).

Figure 11.2 Stunting in children by household wealth

Percentage of children under age 5 who are stunted

Weight measured in the last 3 months

Percentage of children under age 5 who had their weight measured in the last 3 months.

Weight and height measured in the last 3 months

Percentage of children under age 5 who had their weight and height measured in the last 3 months.

Mid-upper-arm circumference (MUAC) measured in the last 3 months

Percentage of children under age 5 who had their MUAC measured in the last 3 months.

Weight, height, and MUAC measured in the last 3 months

Percentage of children under age 5 who had their weight, height, and MUAC measured in the last 3 months.

Sample: Children under age 5

Among Cambodian children under age 5, 20% had weight measurements taken, 8% had height measurements taken, and 6% had MUAC measurement taken in the last 3 months. Overall, 8% of children had weight and height measurements taken and 5% had weight, height, and MUAC measurements taken (**Table 11.2**).

Patterns by background characteristics

- The percentage of children who had measurements taken for weight, height, and MUAC were higher among those whose mothers have more than a secondary education (29%, 14%, and 8%, respectively) than among those whose mothers have no education (17%, 9%, and 5%, respectively).
- The percentage of children who had weight and height measurements taken is highest in Stung Treng (34%) and Kratie (33%) and lowest in Kep, Sihanouk, and Prey Veng (1% each).
- The percentage of children who had MUAC measurements taken is highest in Kratie (31%), followed by Preah Vihear (18%) and Siemreap and Stung Treng (14% each).

11.3 INFANT AND YOUNG CHILD FEEDING PRACTICES

Optimal infant and young child feeding (IYCF) practices are critical to the health and survival of young children. Recommended IYCF practices include early initiation of breastfeeding (within the first hour after birth), exclusive breastfeeding for the first 2 days after birth, exclusive breastfeeding for the first 6 months of life, continued breastfeeding for 2 years or more, and introduction of safe, appropriate, and adequate complementary foods at age 6 months. This section reports on IYCF indicators for children under age 2 (WHO and UNICEF 2021).

11.3.1 Ever Breastfed, Early Initiation of Breastfeeding, and Exclusive Breastfeeding for the First 2 Days after Birth

Breastfeeding supports children's growth and development and also benefits mothers' health. Initiation of breastfeeding within the first hour of birth is important for both the mother and the child. The first breast milk contains colostrum, which is highly nutritious and has antibodies that protect the newborn from infections. Early initiation of breastfeeding also encourages bonding between the mother and her newborn, especially through skin-to-skin contact, which facilitates the production of breast milk. Feeding newborns anything other than breast milk in the first 2 days after birth can delay early initiation of breastfeeding and interrupt exclusive breastfeeding and is not recommended unless medically indicated (WHO and UNICEF 2021).

Ever breastfed

Percentage of children age 0–23 months who were ever breastfed.

Early initiation of breastfeeding

Percentage of children age 0–23 months who were put to the breast within 1 hour of birth.

Exclusive breastfeeding for the first 2 days after birth

Percentage of children age 0–23 months who were fed exclusively with breast milk for the first 2 days after birth.

Sample: Children age 0–23 months

Table 11.3 shows that among last-born children born in the 2 years preceding the survey, 82% were breastfed at some point. Fifty-four percent of children were breastfed within 1 hour of birth and 50% were exclusively breastfed for the first 2 days after birth.

Patterns by background characteristics

- The prevalence of early breastfeeding is higher among women who received counseling during antenatal care than among those who did not receive counseling or didn't know (56% versus 42%). It is also higher among women who were observed breastfeeding during postnatal care than among those who were not observed or didn't know (57% versus 49%).
- The percentage of children exclusively breastfed for the first 2 days after birth is higher among those whose mothers received counseling during antenatal care than among those whose mothers did not receive counseling or didn't know (52% versus 42%).
- Early initiation of breastfeeding is higher among women who were assisted by health personnel at delivery (54%) than among those assisted by a traditional birth attendant (35%). Conversely, exclusive breastfeeding during the first 2 days after birth is higher among women who were assisted by a traditional birth attendant (83%) than among those assisted by health personnel (50%).

- By place of birth, early initiation of breastfeeding is higher among children born at a health facility (54%) than those born at home (50%). However, the opposite is true for children exclusively breastfed for the first 2 days after birth (86% among home births and 50% among health facility births).
- Both early initiation of breastfeeding and exclusive breastfeeding during the first 2 days after birth are higher among women who had vaginal births (60% and 57%, respectively) than among those who had cesarean sections (25% and 22%, respectively).
- The prevalence of early breastfeeding and exclusive breastfeeding during the first 2 days after birth generally declines with increasing mother's education and household wealth.

11.3.2 Exclusive Breastfeeding and Mixed Milk Feeding

In the first 6 months, children should be exclusively breastfed; that is, they should be given nothing but breast milk. Exclusive breastfeeding for 6 months lowers the risk of infections that can lead to diarrhea and respiratory illnesses and provides all of the nutrients and liquid an infant requires for optimal growth and development. Mixed milk feeding, in which children are fed both breast milk and formula or animal milk within the first 6 months, has the adverse effect of reducing breast milk output because the production of breast milk is modulated by the frequency and intensity of suckling. Mixed feeding under age 6 months also can increase children's risk of diarrhea, alter their intestinal microflora, and lead to early cessation of breastfeeding (WHO and UNICEF 2021).

Exclusive breastfeeding

Percentage of children age 0–5 months who were fed exclusively with breast milk during the previous day.

Sample: Youngest children age 0–5 months living with their mother

Mixed milk feeding

Percentage of children age 0–5 months who were fed both breast milk and formula or animal milk during the previous day.

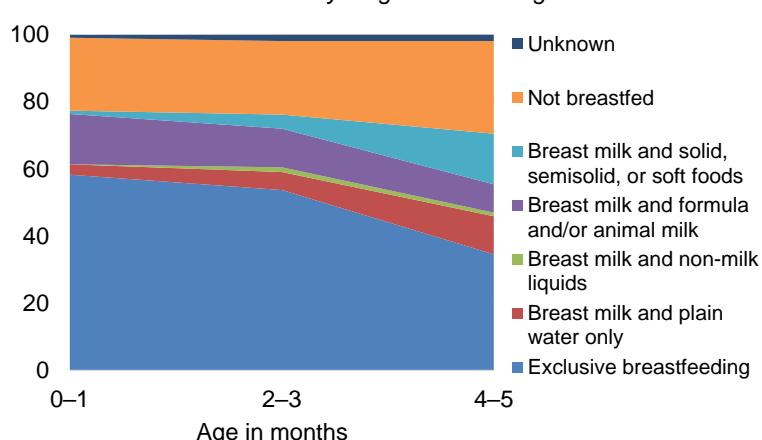

Sample: Youngest children age 0–5 months living with their mother

Table 11.5 and **Figure 11.3** show feeding practices among children in the first 6 months. At age 0–1 month, 60% of children are exclusively breastfed as per WHO recommendations; 40% of children are not being fed according to recommended guidelines, with 20% not breastfed and 15% receiving breast milk and formula and/or animal milk. By age 2–3 months, there is a small decline in the percentage of children exclusively breastfed, with 45% of children receiving liquids or foods other

than breast milk. By age 4–5 months, the percentage of children exclusively breastfed declines to 36%. Twenty-five percent of children are not breastfed, while 39% are receiving liquids or foods other than breast milk, with solid, semisolid, or soft foods accounting for the highest percentage (16%) (**Table 11.5** and **Figure 11.3**).

Figure 11.3 Infant feeding practices by age

Percent distribution of youngest children age 0–5 months

Trends: Exclusive breastfeeding among children under age 6 months increased substantially from 11% in 2000 to 65% in 2014 before declining to 50% in 2021–22.

Patterns by background characteristics

- Exclusive breastfeeding is higher in rural areas (58%) than in urban areas (35%) (**Table 11.4**).
- By province, exclusive breastfeeding ranges from a high of 77% in Preah Vihear to a low of 26% in Takeo.
- Exclusive breastfeeding generally declines with increasing mother's education and household wealth.

11.3.3 Continued Breastfeeding and Bottle Feeding

Breastfeeding should continue for the first 2 years or beyond because breast milk lowers children's risk of illness, promotes their recovery during illness, and remains an important source of nutrients for healthy growth and development. Longer durations of breastfeeding have many health benefits for mothers, including reducing risks of certain breast and ovarian cancers and diabetes. The nipple on a feeding bottle is susceptible to contamination and increases the risk of disease among children (WHO and UNICEF 2021). Thus, bottle feeding is not recommended for children under age 2.

Continued breastfeeding

Percentage of children age 12–23 months who were fed breast milk during the previous day.

Sample: Children age 12–23 months

Bottle feeding

Percentage of children age 0–23 months who were fed from a bottle with a nipple during the previous day.

Sample: Children age 0–23 months

Among Cambodian children age 12–23 months, 40% are currently breastfeeding. More than half of children age 0–23 months are bottle fed (53%) (**Table 11.4**).

Patterns by background characteristics

- Continued breastfeeding among children age 12–23 months is higher in rural than urban areas (50% versus 28%) and declines with increasing mother's education and wealth.
- Bottle feeding is higher in urban areas than rural areas (69% versus 43%) and increases with increasing mother's education and wealth.
- By province, continued breastfeeding is highest in Ratanak Kiri (79%) and lowest in Phnom Penh (21%). Bottle feeding is highest in Takeo (73%) and lowest in Preah Vihear and Stung Treng (18% each).

11.3.4 Introduction of Complementary Foods

After the first 6 months, breast milk alone is no longer sufficient to meet all of the nutritional needs of an infant. After 6 months, appropriate complementary foods should be introduced while breastfeeding is continued to until age 2 or older. The transition from exclusive breastfeeding to complementing breastfeeding with family foods is when children are most vulnerable to becoming undernourished. During this time, it is important that children receive solid, semisolid, or soft foods (WHO 2003; WHO and UNICEF 2021).

Introduction of solid, semisolid, or soft foods

Percentage of children age 6–8 months who were fed solid, semisolid, or soft foods during the previous day.

Sample: Youngest children age 6–8 months living with their mother

According to the 2021–22 CDHS results, 88% of children were introduced to solid, semisolid, or soft foods at age 6–8 months (**Table 11.10**).

11.3.5 Minimum Dietary Diversity, Minimum Meal Frequency, Minimum Milk Feeding Frequency, Minimum Acceptable Diet, and Egg and/or Flesh Food Consumption

Infants and young children should be fed a minimum acceptable diet, which means that they are fed meals with appropriate frequency and a variety of foods to meet their energy and nutrient needs. The minimum acceptable diet indicator is a combination of minimum dietary diversity and minimum meal frequency for breastfeeding children and the same combination along with minimum milk feeding frequency for nonbreastfed children.

Minimum dietary diversity is a proxy for adequate micronutrient density of foods. Consumption of food from at least five groups means that the child has a higher likelihood of consuming at least one animal source of food and at least one fruit or vegetable in addition to a staple food such as grains, roots, or tubers. The five groups should come from a list of eight food groups: breast milk; grains, roots, and tubers; legumes and nuts; dairy products (milk, yogurt, and cheese); flesh foods (meat, fish, poultry, and organ meat); eggs; vitamin A-rich fruits and vegetables; and other fruits and vegetables.

Minimum meal frequency is a proxy for meeting energy requirements. Breastfed children age 6–8 months are considered to be fed with a minimum meal frequency if they receive solid, semisolid, or soft foods at least twice a day. Breastfed children age 9–23 months are considered to be fed with a minimum meal frequency if they receive solid, semisolid, or soft foods at least three times a day. Nonbreastfed children age 6–23 months are considered to be fed with a minimum meal frequency if they receive solid, semisolid, or soft foods or milk feeds at least four times a day and if at least one of the feeds is a solid, semisolid, or soft food.

Minimum milk feeding frequency is a proxy for meeting the nutrient needs of nonbreastfed children. Milk and milk products are important sources of nutrients. Nonbreastfed children age 6–23 months are considered to be fed with a minimum milk feeding frequency if they receive at least two feeds of milk and/or milk products each day.

Egg and/or flesh food consumption by breastfed and nonbreastfed children age 6–23 months increases energy, protein, and nutrient intake. Eggs, meat, fish, poultry, and organ meats are important sources of nutrients that support healthy child growth (WHO and UNICEF 2021).

Minimum dietary diversity

Percentage of children age 6–23 months who were fed a minimum of five out of eight defined food groups during the previous day. The eight food groups are as follows: breast milk; grains, roots, and tubers; legumes and nuts; dairy products (milk, yogurt, and cheese); flesh foods (meat, fish, poultry, and organ meat); eggs; vitamin A-rich fruits and vegetables; and other fruits and vegetables.

Minimum meal frequency

Percentage of children age 6–23 months who were fed solid, semisolid, or soft foods (including milk feeds for nonbreastfed children) the minimum number of times or more during the previous day.

Minimum milk feeding frequency

Percentage of nonbreastfed children age 6–23 months who were given at least two milk feeds during the previous day.

Minimum acceptable diet

Percentage of children age 6–23 months who were fed a minimum acceptable diet during the previous day. This indicator is a composite of children fed with a minimum dietary diversity and a minimum meal frequency, with the additional requirement that nonbreastfed children are fed with a minimum milk feeding frequency.

Sample: Youngest children age 6–23 months living with their mother

Egg and/or flesh food consumption

Percentage of children age 6–23 months who were fed eggs and/or flesh food during the previous day.

Sample: Youngest children age 6–23 months living with their mother

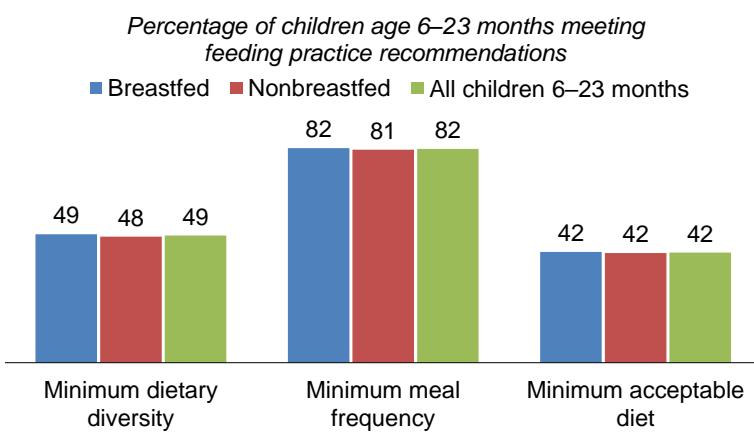

Table 11.8 and **Figure 11.4** present the percentages of children age 6–23 months meeting the minimum standard with respect to IYCF feeding practices. Overall, 49% of children received the minimum number of food groups the previous day (49% of breastfed children and 48% of nonbreastfed children). Eighty-two percent of children were fed the minimum number of times appropriate for their age (82% of breastfed children and 81% of nonbreastfed children). Among nonbreastfed children, 76% received the minimum number of milk feeds the previous day. Overall, 42% of children were fed a minimum acceptable diet the previous day (42% of both breastfed and nonbreastfed children) (**Table 11.8**).

In terms of egg and/or flesh food consumption, 83% of Cambodian children age 6–23 months were given eggs and/or flesh foods the previous day (**Table 11.9**).

Patterns by background characteristics

- Minimum dietary diversity, minimum acceptable diet, and egg and/or flesh food consumption generally improve with increasing age.

Figure 11.4 IYCF indicators on minimum acceptable diet by breastfeeding status

- The percentages of children who are fed with a minimum dietary diversity, who are fed a minimum acceptable diet, and who consume eggs and/or flesh food are higher in urban areas (60%, 54%, and 88%, respectively) than in rural areas (42%, 35%, and 80%, respectively).
- Minimum dietary diversity, minimum meal frequency, minimum milk feeding frequency, and minimum acceptable diet all improve with increasing mother's education.
- Egg and/or flesh food consumption generally increases with increasing household wealth.
- By province, the percentage of children fed a minimum acceptable diet is highest in Phnom Penh (72%) and lowest in Tboung Khmum (11%). Egg and/or flesh food consumption is also highest in Phnom Penh (96%) and lowest in Tboung Khmum (58%).

11.3.6 Sweet Beverage Consumption, Unhealthy Food Consumption, and Lack of Vegetable or Fruit Consumption among Children

Unhealthy infant and young child feeding practices should be avoided because they can replace nutritious foods that provide important nutrients for children and promote unhealthy weight gain. For infants and young children, consumption of sweet foods and beverages increases the risk of dental caries and obesity in childhood. In addition, too much salt in the diet increases the risk of noncommunicable diseases, and unhealthy fats and refined carbohydrates contribute to unhealthy weight gain. Children consuming diets low in vegetables and fruits have reduced nutrient intakes, which can negatively impact healthy growth and development; low vegetable and fruit consumption is also associated with noncommunicable diseases later in life. The indicator definition below for unhealthy food consumption describes “sentinel unhealthy foods,” which are foods high in sugar, salt, and/or unhealthy fats that are commonly consumed by infants and young children (WHO and UNICEF 2021).

Sweet beverage consumption

Percentage of children age 6–23 months who were given a sweet beverage during the previous day.

Unhealthy food consumption

Percentage of children age 6–23 months who were fed sentinel unhealthy foods during the previous day.

No vegetable or fruit consumption

Percentage of children age 6–23 months who were not fed any vegetables or fruits during the previous day.

Sample: Youngest children age 6–23 months living with their mother

Table 11.9 shows the percentage of children age 6–23 months with unhealthy feeding practices. More than a quarter of children (28%) were given a sweet beverage, 21% were fed unhealthy foods, and 29% were not given any vegetables or fruits the previous day.

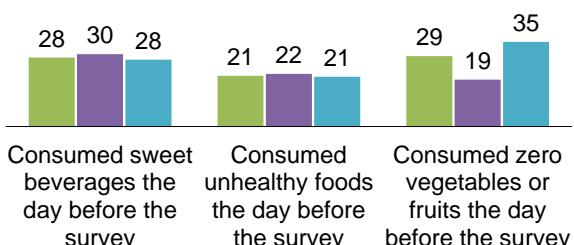

Patterns by background characteristics

- Sweet beverage and unhealthy food consumption increase with increasing age. The opposite is true for lack of vegetable/fruit consumption, which declines with increasing age.
- Children in rural areas (35%) are more likely than those in urban areas (19%) to receive no vegetables or fruits. There are virtually no differences between urban and rural areas with respect to sweet beverage and unhealthy food consumption (**Figure 11.5**).
- Sweet beverage consumption is highest in Kampot (42%) and lowest in Tboung Khmum (14%); unhealthy food consumption is highest in Pailin (49%) and lowest in Kampong Cham (4%); and lack of vegetable/fruit consumption is highest in Tboung Khmum (65%) and lowest in Phnom Penh (9%).

Figure 11.5 Unhealthy feeding practices among children age 6–23 months by residence

Percentage of children age 6–23 months

■ Total ■ Urban ■ Rural

11.3.7 Infant and Young Child Feeding (IYCF) Indicators

Table 11.10 summarizes 16 of WHO-UNICEF IYCF indicators.

11.4 INFANT AND YOUNG CHILD FEEDING COUNSELING

IYCF counseling helps support appropriate breastfeeding and complementary feeding practices (WHO 2003; WHO 2018). Counseling is an interactive process that helps empower mothers and caregivers to follow the recommended IYCF practices. Counseling can take place in health facilities or the community and is delivered by trained health providers, community health workers, and others in the community.

Mothers who received IYCF counseling in the last 6 months

Percentage of mothers with children age 6–23 months who received IYCF counseling in the last 6 months from a health care provider or community health worker.

Sample: Women whose youngest child age 6–23 months is living with them

Six percent of women with a child age 6–23 months received counseling on how to feed their child in the last 6 months (**Table 11.11**).

Patterns by background characteristics

- Receipt of IYCF counseling declines with increasing age, from 8% among women age 15–19 to 5% among women age 40–49.
- Women in rural areas (8%) are more likely than those in urban areas (3%) to receive IYCF counseling.
- Receipt of IYCF counseling declines with increasing education and wealth.

11.5 MICRONUTRIENT SUPPLEMENTATION AND DEWORMING AMONG CHILDREN

Micronutrient deficiency is a major contributor to childhood morbidity and mortality. Micronutrient deficiency can be caused by a lack of consumption of foods that supply vitamins and minerals, as well as by infections and genetic abnormalities. Strategies to prevent or address micronutrient deficiency include agricultural approaches such as biofortification, food-based approaches that can be complemented with food fortification, and, for specific life stages and population groups, direct micronutrient supplementation (USAID 2019).

Iron is a micronutrient that plays an important role in numerous biological systems. Iron deficiency is one of the primary causes of anemia. Interventions targeting iron deficiency and anemia include periodically giving children iron tablets or syrup and/or iron-containing micronutrient powders (WHO 2011a; WHO 2016a; WHO 2016b).

Vitamin A is a micronutrient that supports the immune system and plays an important role in maintaining the epithelial tissue in the body. Severe vitamin A deficiency can cause eye damage, increase the severity of infections such as those causing measles, and slow recovery from illness. Vitamin A supplementation programs help reduce vitamin A deficiency and mortality in children (WHO 2011b).

Soil-transmitted helminth infections can cause internal bleeding, inflammation, impaired nutrient absorption, diarrhea, vomiting, and loss of appetite. Deworming programs help reduce the burden of helminth infections (WHO 2017b).

Iron tablets or syrup

Percentage of children age 6–59 months who were given iron tablets or syrup in the last 12 months.

Multiple micronutrient powders

Percentage of children age 6–59 months who were given multiple micronutrient powders in the last 12 months.

Iron-containing supplements

Percentage of children age 6–59 months who were given iron-containing supplements in the last 12 months, including tablets, syrup, or micronutrient powders.

Sample: Children age 6–59 months

Vitamin A supplements

Percentage of children age 6–59 months who were given vitamin A supplements in the last 6 months.

Sample: Children age 6–59 months

Deworming medication

Percentage of children age 12–59 months who were given deworming medication in the last 6 months.

Sample: Children age 12–59 months

The 2021–22 CDHS collected information on iron-containing supplementation, vitamin A supplementation, and deworming (**Table 11.12**). Overall, 15% of children age 6–59 months were given iron-containing supplements in the last 12 months, including iron tablets or syrup (14%) and multiple micronutrient powders (4%). Forty percent of children age 6–59 months were given vitamin A supplements and 47% of children age 12–59 months were given deworming medication in the last 6 months.

Patterns by background characteristics

- The proportion of children given iron-containing supplements generally increases with increasing household wealth.
- The proportion of children given vitamin A supplements increases from 33% among those whose mothers have no education to 43% among those whose mothers have more than a secondary education. The pattern is similar for iron-containing supplements and deworming medication.
- The proportion of children given deworming medication is lowest among those whose mothers are age 15–19 (36%) and highest among those whose mothers are age 40–49 (48%).

11.6 ADULTS' NUTRITIONAL STATUS

Chronic energy deficiency is caused by eating too little or having an unbalanced diet that lacks adequate nutrients. Women of reproductive age (age 15–49) are especially vulnerable to chronic energy deficiency and malnutrition due to low dietary intakes, inequitable distribution of food within the household, improper food storage and preparation, dietary taboos, infectious diseases, and inadequate care practices. Chronic energy deficiency leads to low productivity among adults and greater morbidity and mortality (WHO 1995). In addition, undernutrition among women is a major risk factor for adverse birth outcomes. Overweight and obesity have adverse health outcomes as well. Overweight and obesity are major risk factors for several chronic diseases, including diabetes, cardiovascular diseases, and cancer.

Body mass index (BMI) is the ratio of weight relative to height squared; it is used to measure nutritional status among adults age 20–49. BMI values are independent of age and sex. Adult women age 20–49 whose height is less than 145 centimeters are characterized as being of short stature.

BMI-for-age, the ratio of weight relative to height for different age groups, is used to measure nutritional status among children and adolescents age 5–19 (WHO 2007). BMI-for-age is sex and age specific. The reason is that adolescents are still growing and the timing of peak growth velocity differs in boys and girls. In the DHS surveys, BMI-for-age is reported among adolescents age 15–19. Similarly, short stature among adolescent women (age 15–19) is assessed according to low height-for-age.

Body mass index (BMI)

BMI is calculated by dividing weight in kilograms by height in meters squared (kg/m^2).

Adult status	BMI
Too thin for height	Less than 18.5
Normal	Between 18.5 and 24.9
Overweight	Between 25.0 and 29.9
Obese	Greater than or equal to 30.0

Sample: Women age 20–49 who are not pregnant and who have not had a birth in the 2 months before the survey

BMI-for-age

BMI-for-age is measured in z score standard deviations (SD)

Adolescent status	BMI-for-age
Too thin for height	Less than -1 SD
Normal	Between -1 SD and +1 SD
Overweight	Between +1 SD and +2 SD
Obese	Greater than +2 SD

Sample: Women age 15–19 who are not pregnant and who have not had a birth in the 2 months before the survey

Short stature

Percentage of women age 20–49 with height under 145 cm.

Sample: Women age 20–49

Percentage of women age 15–19 with height-for-age z score less than -2 SD.

Sample: Women age 15–19

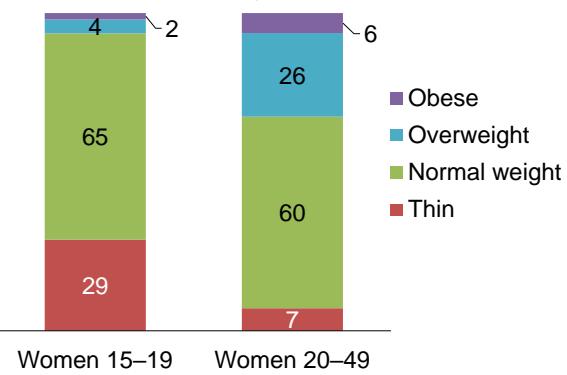

Height and weight data were collected for 99% of eligible women age 15–49 (Appendix Table C.6). During measurements, 3% of women had hairstyles or ornamentation that interfered with height measurement, and 2% of women were not wearing lightweight clothing or wore heavy permanent ornaments that interfered with weight measurement (Appendix Table C.11).

Among women age 20–49, data on height and weight were used to calculate two measures of nutritional status: height and BMI. Overall, 4% of women are shorter than 145 cm. A total of 7% of women are thin, with 5% mildly thin and 2% moderately or severely thin. Thirty-three percent of women are overweight or obese, with 26% being overweight and 6% being obese (Table 11.13.1 and Figure 11.6).

Among adolescent women age 15–19, data on height, weight, and age were used to calculate two measures of nutritional status: height-for-age and BMI-for-age. Overall, 14% of young women have a height-for-age z score below -2 SD. Twenty-nine percent of young women are thin, with 24% being mildly thin and 4% being moderately or severely thin. In addition, 6% of young women are overweight or obese, including 4% who are overweight and 2% who are obese (Table 11.13.2 and Figure 11.6).

Figure 11.6 Nutritional status of adolescent and adult women

Percent distribution of women age 15–19 and 20–49 by nutritional status

Patterns by background characteristics

- The percentage of women age 20–49 with short stature is higher among older women than younger women (5% and 3%, respectively). On the other hand, younger women are more likely to be thin (13%) than older women (4%).
- Among women age 20–49, short stature decreases with increasing education, from 6% among women with no education to less than 1% among those with more than a secondary education. The opposite is true for thinness; the proportion of women who are thin increases from 5% among women with no education to 18% among women with more than a secondary education.
- Among women age 20–49, overweight/obesity decreases with increasing education, from 39% among women with no education to 15% among those with more than a secondary education. In contrast, overweight/obesity generally increases with increasing household wealth, from 26% among women in the lowest wealth quintile to 35% among women in the highest quintile.
- The proportion of thin women age 20–49 is highest in Kampong Chhnang (17%) and lowest in Ratanak Kiri (1%). Overweight/obesity is highest in Kampong Cham (39%) and lowest in Ratanak Kiri (12%).
- Among young women age 15–19, short stature declines with increasing education and household wealth. Thirty-three percent of women with no education are of short stature, as compared with 6% of women with more than a secondary education. Similarly, 27% of women in the highest wealth quintile are of short stature, compared with 8% of those in the lowest wealth quintile.
- Overweight among young women is higher in rural areas than urban areas (5% versus 3%), but obesity is higher in urban areas (4% versus 1%).
- Among young women, thinness increases with increasing education, from 14% among those with no education to 36% among those with more than a secondary education.

11.7 WOMEN'S DIETARY PRACTICES

Dietary practices that support a healthy diet include eating a variety of different foods and food groups and limiting consumption of sugary beverages and unhealthy foods. Eating a variety of unprocessed foods helps women consume the appropriate amount of essential vitamins and minerals. A healthy diet also protects against overweight, obesity, and noncommunicable diseases.

Minimum dietary diversity for women is an indicator of diet diversity validated for nonpregnant women age 15–49. The indicator is based on 10 food groups: grains, white/pale starchy roots, tubers, and plantains; pulses (beans, peas, and lentils); nuts and seeds; dairy (milk and milk products); flesh foods (meat, fish, poultry, and organ meat); eggs; dark green leafy vegetables; vitamin-A rich fruits and vegetables; other vegetables; and other fruits. Women who consumed at least five of the 10 possible food groups in the 24 hours before the survey were classified as having minimally adequate dietary diversity. Deficiencies in micronutrients such as iron, iodine, vitamin A, folate, and zinc can have devastating consequences for the human body. Women, particularly those of childbearing age, are especially vulnerable due to their greater needs for essential vitamins and minerals. Having minimally adequate dietary diversity is important for micronutrient adequacy (FAO 2021).

Unhealthy foods and sweet beverages should be limited because they are associated with overweight, obesity, and noncommunicable diseases (Askari et al. 2020). Overweight and obesity among women can affect reproductive health and increase complications in pregnancy (Mitchell and Shaw 2015). The indicator for unhealthy food consumption describes “sentinel unhealthy foods,” which are fried foods or foods high in sugar, salt, and/or unhealthy fats that are commonly consumed by women (FAO 2021).

Minimum dietary diversity for women

Percentage of women who consumed foods from at least five out of 10 defined food groups during the previous day. The 10 food groups are as follows: grains, white/pale starchy roots, tubers, and plantains; pulses (beans, peas, and lentils); nuts and seeds; dairy (milk and milk products); flesh foods (meat, fish, poultry, and organ meat); eggs; dark green leafy vegetables; vitamin-A rich fruits and vegetables; other vegetables; and other fruits.

Sample: Women age 15–49

Sweet beverage consumption

Percentage of women who consumed sweet beverages during the previous day.

Sample: Women age 15–49

Unhealthy food consumption

Percentage of women who consumed selected sentinel unhealthy foods during the previous day.

Sample: Women age 15–49

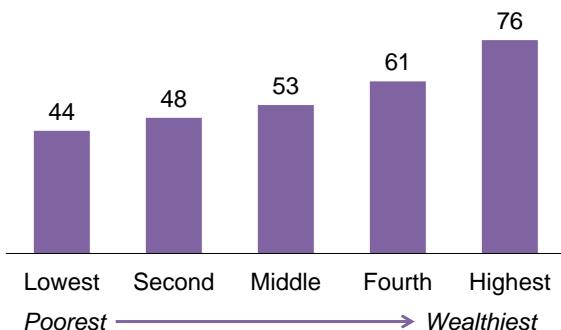

The 2021–22 CDHS is the first CDHS survey to collect data on foods and liquids consumed in the previous day by women age 15–49. **Table 11.14** shows that commonly consumed foods are foods made from grains (99%); meat, fish, poultry, and organ meats (97%); dark green leafy vegetables (65%); other vegetables (55%); and other fruits (51%). Consumption of beans, peas, and lentils (11%); nuts and seeds (7%); and insects and other small protein foods (5%) is low. **Table 11.15** shows that 57% of women consumed foods from at least five of the 10 possible food groups (minimum dietary diversity) the previous day, 63% consumed sweet beverages, and 33% consumed unhealthy foods.

Patterns by background characteristics

- The percentage of women achieving minimum dietary diversity is higher in urban areas (68%) than in rural areas (50%) and increases with increasing education and household wealth (**Figure 11.7**).
- Sweet beverage consumption is higher in urban areas (70%) than rural areas (58%); declines with age, from 67% among women age 15–19 to 58% among women age 40–49; and generally increases with increasing education.
- Unhealthy food consumption declines with age, from 43% among women age 15–19 to 25% among women age 40–49, and increases with increasing education, from 27% among women with no education to 44% among women with more than a secondary education.
- The percentage of women achieving minimum dietary diversity is highest in Preah Sihanouk (80%) and lowest in Tboung Khmum (29%), the percentage consuming sweet beverages is highest in Kampong Speu and Phnom Penh (76% each) and lowest in Preah Vihear (33%), and the percentage consuming unhealthy foods is highest in Pailin (49%) and lowest in Tboung Khmum (13%).

Figure 11.7 Minimum dietary diversity among women by household wealth

Percentage of women age 15–49 achieving minimum dietary diversity the day before the survey

11.8 PRESENCE OF IODIZED SALT IN HOUSEHOLDS

Iodine is a micronutrient that plays an important role in thyroid function, which is critical for reproductive function, growth, and development. It is recommended that household salt be fortified with iodine. Sufficient iodine prevents goiter, brain damage, and other thyroid-related health problems (WHO 2014b).

Household salt iodization

Percentage of households with iodized salt.

Sample: Households in which salt was tested for iodine content

In Cambodia, salt is fortified with potassium iodide or potassium iodate. The 2021–22 CDHS tested for the presence of iodine in household salt using a rapid test kit.

Table 11.16 shows that 49% of households have iodized salt, a decrease from 2010 (83%) and 2014 (69%). The proportion of households with iodized salt is higher in urban (64%) than rural (39%) areas and is lowest in Kep (19%) and Kampong Cham (22%) and highest in Mondul Kiri (77%), Phnom Penh (73%), and Koh Kong (73%). The proportion of households with iodized salt increases with increasing household wealth, from 30% in the lowest wealth quintile to 75% in the highest wealth quintile.

LIST OF TABLES

Note: Each of the indices is expressed in standard deviation units (SD) from the median of the WHO Child Growth Standards. Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ Recumbent length is measured for children under age 2; standing height is measured for all other children.

² Includes children who are below -3 standard deviations (SD) from the WHO Child Growth standards population median

³ Excludes children whose mothers were not interviewed

⁴ First-born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval.

⁵ Information available only for children age 0–35 months

⁶ Includes children whose mothers are deceased

⁷ Excludes children whose mothers were not weighed and measured, children whose mothers were not interviewed, and children whose mothers are pregnant or gave birth within the preceding 2 months. Mother's nutritional status was defined using body mass index (BMI) for mothers age 20–49 and BMI-for-age for mothers age 15–19 (as presented in Tables 11.13.1 and 11.13.2).

⁸ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the Household Questionnaire. Excludes one missing case.

Table 11.2 Child growth monitoring

Percentage of children under age 5 who had selected measurements performed by a health care provider in the 3 months preceding the survey, according to background characteristics, Cambodia DHS 2021–22

Highest	71.5	45.4	34.3	615
Total	81.8	54.0	50.4	3,322

Note: Table is based on children born in the 2 years preceding the survey regardless of whether the children were living or dead at the time of the interview. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

ANC = Antenatal care

PNC = Postnatal care

¹ Children given nothing other than breast milk to eat or drink during the first 2 days after delivery

² Information available for the most recent live birth only

³ Doctor, nurse/midwife, or auxiliary midwife

⁴ Women were asked about counseling on breastfeeding by any health care provider in the first 2 days after their most recent live birth regardless of where they gave birth.

Table 11.4 Breastfeeding status according to age

Among youngest children age 0–5 months living with their mother, percentage exclusively breastfeeding and percentage receiving mixed milk feeding; among all children age 12–23 months, percentage currently breastfeeding; and among all children age 0–23 months, percentage using a bottle with a nipple, according to background characteristics, Cambodia DHS 2021–22

Background characteristic	Among youngest children age 0–5 months living with their mother:			Among all children age 12–23 months:		Among all children age 0–23 months:

Note: Breastfeeding status refers to a “24-hour” period (yesterday during the day or at night). Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

na = not applicable

¹ Received breast milk; fresh, packaged, or powdered animal milk; or infant formula. Excludes yogurt drinks because they are generally not fed as a substitute for breast milk. Excludes soy and nut milks.

² Corresponds to the IYCF indicator “continued breastfeeding”

Table 11.5 Infant feeding practices by age

Percent distribution of youngest children age 0–5 months living with their mother by feeding category, according to age in months, Cambodia DHS 2021–22

Age in months	Breast milk only (exclusively breastfed)	Breast milk and plain water only	Breast milk and non-milk liquids ¹	Breast milk and formula and/or animal milk ²	Breast milk and solid, semisolid, or soft foods ³	Not breastfed	Unknown ⁴	Total	Number of youngest children age 0–5 months living with their mother
0–1	59.7	3.1	0.0	15.4	1.0	19.9	0.9	100.0	259
2–3	55.1	5.5	1.4	10.8	4.3	20.9	2.1	100.0	284
4–5	36.0	11.8	1.1	8.6	15.7	24.7	2.0	100.0	266
0–5	50.3	6.8	0.9	11.5	7.0	21.8	1.7	100.0	809

Note: Breastfeeding status refers to a “24-hour” period (yesterday during the day or at night). The categories of breast milk only; breast milk and plain water only; breast milk and non-milk liquids; breast milk and formula and/or animal milk; breast milk and solid, semisolid, or soft foods; and not breastfed are hierarchical and mutually exclusive. Thus, children who receive breast milk and non-milk liquids and who do not receive breast milk and formula and/or animal milk and who do not receive any solid, semisolid, or soft foods are classified in the non-milk liquid category even though they may also get plain water. When combined with children whose feeding category is classified as unknown due to “don’t know” responses, the percentages in each row add to 100%.

¹ Non-milk liquids include fruit juice or fruit-flavored drinks, chocolate-flavored drinks, sodas, malt drinks, sports drinks, energy drinks, clear broth or soup, tea, coffee, herbal drinks, soy milk, nut milk, and other liquids.

² Animal milk here includes liquid yogurt but does not include solid yogurt. Note that animal milk in Table 11.4 excludes liquid yogurt and solid yogurt.

³ Solid, semisolid, or soft foods includes solid yogurt but not liquid yogurt.

⁴ Not classified elsewhere due to “don’t know” responses

Table 11.6 Liquids consumed by children in the day or night preceding the interview

Percentage of youngest children under age 2 living with their mother by type of liquids consumed in the day or night preceding the interview, according to age and breastfeeding status, Cambodia DHS 2021–22

Note: Figures in parentheses are based on 25–49 unweighted cases.

¹ Includes bread, rice, noodles, pasta, bobor (porridge) krub kroeung or other porridge, rice pancakes (num banh chhev), glass noodles (kuy teav), bread, and rice noodles (num banhchok)

² Includes white potatoes, white yams, manioc, cassava, white or purple sweet potatoes (damlong chvea), taro, and other local potatoes (e.g., damlong prey, damlong daikla)

³ Includes sandek, sunflower seeds, pumpkin seeds, and watermelon seeds

⁴ Includes hard and soft cheeses

⁵ Includes liver, kidney, heart, lung, blood, sausages, hot dogs, frankfurters, ham, bacon, salami, canned meat, beef, buffalo pork, lamb, goat, chicken, duck, frog, eel, shrimp, fish (fresh, dried, canned fermented), and shellfish

⁶ Includes pumpkin, carrots, squash, or sweet potatoes that are yellow or orange inside; ripe mangoes; ripe papayas; dark green leafy vegetables such as

⁷ Includes ivy gourd leaves (slek bas), moringa leaves (slek m'rom), green amaranth (slek pty), morning glory, bok choy (speytteu), mustard greens, pumpkin leaf, sweet leaf bush (slek ngob), cassava leaves, spinach, tree spinach (chaya), kale, and wild greens (slek prech); tomato; eggplant; cauliflower (pakakhatna); winter melon (tra lach); long beans; mushrooms; and other vegetables

⁸ Includes crickets, bug bacon, snails, spiders, termites, and grasshoppers

Table 11.8 Minimum dietary diversity, minimum meal frequency, and minimum acceptable diet among children

Percentage of youngest children age 6–23 months living with their mother who are fed a minimum acceptable diet based on breastfeeding status, number of food groups, and times they are fed during the day or night preceding the survey, according to background characteristics, Cambodia DHS 2021–22

Background characteristic	Among youngest breastfed children age 6–23 months living with their mother, percentage fed:				Among youngest nonbreastfed children age 6–23 months living with their mother, percentage fed:				Among all youngest children age 6–23 months living with their mother, percentage fed:			
	Minimum dietary diversity ¹	Minimum meal frequency ²	Minimum acceptable diet ³	Number of breastfed children age 6–23 months	Minimum milk feeding frequency ⁴				Number of nonbreastfed children age 6–23 months	Minimum dietary diversity ¹	Minimum meal frequency ⁵	Minimum acceptable diet ⁶
					Minimum milk feeding frequency	Minimum dietary diversity ¹	Minimum meal frequency ⁵	Minimum acceptable diet ⁶

Note: Figures in parentheses are based on 25–49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ Minimum dietary diversity is receiving foods from five or more of the following eight food groups: a. breast milk; b. grains, white/pale starchy roots, tubers, and plantains; c. beans, peas, lentils, nuts, and seeds; d. dairy products (tinned, powdered, or fresh animal milk; infant formula; yogurt; cheese); e. flesh foods (meat, fish, poultry, organ meats); f. eggs; g. vitamin A-rich fruits and vegetables; h. other fruits and vegetables.

² For breastfed children, minimum meal frequency is receiving solid, semisolid, or soft food at least twice a day for infants age 6–8 months and at least three times a day for children age 9–23 months.

³ For breastfed children, minimum acceptable diet is being fed a minimum dietary diversity (footnote 1) and a minimum meal frequency (footnote 2).

⁴ For nonbreastfed children, minimum milk feeding frequency is two or more feedings of infant formula; tinned, powdered, or fresh animal milk; and liquid or solid yogurt.

⁵ For nonbreastfed children, minimum meal frequency is receiving solid, semisolid, or soft food or milk feeds at least four times a day. At least one of the feeds must be a solid, semisolid, or soft feed.

⁶ For nonbreastfed children, minimum acceptable diet is being fed a minimum dietary diversity (footnote 1), a minimum milk feeding frequency (footnote 4), and a minimum meal frequency (footnote 5).

⁷ Minimum meal frequency is receiving the minimum recommended number of feeds per day according to age and breastfeeding status as defined in footnotes 2 and 5.

⁸ Minimum acceptable diet is being fed a minimum dietary diversity (footnote 1), a minimum meal frequency (footnotes 2 and 5), and a minimum milk feeding frequency (footnote 4).

Table 11.9 Egg and/or flesh food consumption and unhealthy feeding practices among children age 6–23 months

Percentage of youngest children age 6–23 months living with their mother who consumed eggs and/or flesh food, and percentage who experienced each various specified unhealthy feeding practice, during the day or night preceding the survey, according to background characteristics, Cambodia DHS 2021–22

Background characteristic	Eggs and/or flesh food ¹	Unhealthy feeding practices:			Number of youngest children age 6–23 months living with their mother

¹ Eggs and/or flesh food include meat, fish, poultry, organ meats, and eggs.

² Sweet beverages include sweet/flavored milk and yogurt drinks, sweet/flavored soy milks or nut milks, fruit juice and fruit-flavored drinks, chocolate-flavored drinks, sodas, malt drinks, sports drinks, energy drinks, sweetened tea, coffee, herbal drinks, and other sweetened liquids.

³ Unhealthy foods are a group of sentinel food types that include sweet foods such as cake, dessert soup, cookies, sweet popcorn, candy (skar krop), chocolate, or ice cream and fried and salty foods such as chips, french fries, and dried noodles such as Mama.

⁴ Vegetables or fruits include dark green, leafy vegetables such as ivy gourd leaves (slek bas), moringa leaves (slek m'rom), green amaranth (slek pty), morning glory, bok choy (speytteu), mustard greens, pumpkin leaves or sweet leaf bush (slek ngob), cassava leaves, spinach, tree spinach (chaya), kale, or wild greens (slek prech); pumpkin, carrots, squash, or sweet potatoes that are yellow or orange inside; ripe mangoes; ripe papayas; passion fruits; and other fruits and vegetables including bananas, oranges, watermelon, rambutan, durian, other fruit, tomatoes, eggplant, cauliflower (pakakhatna), winter melon (tra lach), long beans, mushrooms, or other vegetables.

Table 11.10 Infant and young child feeding (IYCF) indicators

Percentage of children fed according to various IYCF practices, Cambodia DHS 2021–22

IYCF #	IYCF abbre- viation	DHS- #	Table Indicator	Indicator definition and denominator	Value
1	EvBF	11.3	Ever breastfed ¹	Percentage of children born in the last 2 years who were ever breastfed Number of children born in the last 2 years	81.8 3,322
2	EIBF	11.3	Early initiation of breastfeeding ¹	Percentage of children born in the last 2 years who were put to the breast within 1 hour of birth Number of children born in the last 2 years	54.0 3,322
3	EBF2 D	11.3	Exclusively breastfed for the first 2 days after birth ¹	Percentage of children born in the last 2 years who were fed exclusively with breast milk for the first 2 days after birth Number of children born in the last 2 years	50.4 3,322
4	EBF	11.4	Exclusive breastfeeding under 6 months	Percentage of children age 0–5 months who were fed exclusively with breast milk during the previous day Number of youngest children age 0–5 months living with the mother	50.3 809
5	MixM F	11.4	Mixed milk feeding under 6 months	Percentage of children age 0–5 months who were fed both breast milk and formula and/or animal milk during the previous day Number of youngest children age 0–5 months living with the mother	13.3 809
6	CBF	11.4	Continued breastfeeding 12–23 months	Percentage of children age 12–23 months who were fed breast milk during the previous day Number of children age 12–23 months	40.4 1,641
7	ISSS F	—	Introduction of solid, semisolid, or soft foods 6–8 months	Percentage of children age 6–8 months who were fed solid, semisolid or soft foods during the previous day Number of youngest children age 6–8 months living with the mother	88.4 407
8	MDD	11.8	Minimum dietary diversity 6–23 months	Percentage of children age 6–23 months who were fed foods and beverages from at least 5 out of 8 defined food groups during the previous day Number of youngest children age 6–23 months living with the mother	48.6 2,321
9	MMF	11.8	Minimum meal frequency 6–23 months	Percentage of children age 6–23 months who were fed solid, semisolid, or soft foods (but also including milk feeds for non-breastfed children) the minimum number of times or more during the previous day Number of youngest children age 6–23 months living with the mother	81.7 2,321
10	MMF F	11.8	Minimum milk feeding frequency for non-breastfed children 6–23 months	Percentage of non-breastfed children age 6–23 months who were given at least two milk feeds during the previous day Number of youngest children age 6–23 months living with the mother who were not breastfed	76.1 1,099
11	MAD	11.8	Minimum acceptable diet 6–23 months	Percentage of children age 6–23 months who were fed a minimum acceptable diet during the previous day Number of youngest children age 6–23 months living with the mother	42.0 2,321
12	EFF	11.9	Egg and/or flesh food consumption 6–23 months	Percentage of children age 6–23 months who were fed egg and/or flesh food during the previous day Number of youngest children age 6–23 months living with the mother	82.9 2,321
13	SWB	11.9	Sweet beverage consumption 6–23 months	Percentage of children age 6–23 months who were given a sweet beverage during the previous day Number of youngest children age 6–23 months living with the mother	28.4 2,321
14	UFC	11.9	Unhealthy food consumption 6–23 months	Percentage of children age 6–23 months who were fed selected sentinel unhealthy foods during the previous day Number of youngest children age 6–23 months living with the mother	20.9 2,321
15	ZVF	11.9	Zero vegetable or fruit consumption 6–23 months	Percentage of children age 6–23 months who were not fed any vegetables or fruits during the previous day Number of youngest children age 6–23 months living with the mother	28.7 2,321
16	BoF	11.4	Bottle feeding 0–23 months	Percentage of children age 0–23 months who were fed from a bottle with a nipple during the previous day Number of children age 0–23 months	53.1 3,290

¹ Includes children born in the 2 years preceding the survey regardless of whether the children are living or dead at the time of interview

Table 11.11 Infant and young child feeding counseling

Among women age 15–49 whose youngest child age 6–23 months is living with them, percentage who talked with a health care provider or community health worker about how or what to feed their child in the last 6 months, according to background characteristics, Cambodia DHS 2021–22

Background characteristic	C counseled in last 6 months about how or what to feed their child	Number of women whose youngest child age 6–23 months is living with them

Note: Body mass index (BMI) is expressed as the ratio of weight in kilograms to the square of height in meters (kg/m^2).

¹ Excludes pregnant women and women with a birth in the preceding 2 months

Table 11.13.2 Nutritional status of adolescent women age 15–19

Among women age 15–19, percentage with height-for-age below –2 standard deviations (SD), mean body mass index (BMI)-for-age z score, and percentage with specific BMI-for-age levels, according to background characteristics, Cambodia DHS 2021–22

Background characteristic	Short stature		Body mass index (BMI)-for-age ¹								
	Height-for-age below –2 SD	Number of women	Mean BMI-for-age z score	–1 SD to +1 SD (total normal)	Below –1 SD (total thin) ²	Below –1 SD to –2 SD (mildly thin)	Below –2 SD (moderately or severely thin)	Above +1 SD (total overweight or obese) ³	Above +1 SD to +2 SD (overweight)	Above +2 SD (obese)	Number of women

Note: Height-for-age and body mass index (BMI)-for-age are expressed in standard deviation units (SD) from the median of the WHO Growth Reference for adolescent women age 15–19. Figures in parentheses are based on 25–49 unweighted cases.

¹ Excludes pregnant women and women with a birth in the preceding 2 months

² Includes adolescent women age 15–19 who are below –2 standard deviations (SD) from the WHO Growth Reference population median

³ Includes adolescent women age 15–19 who are above +2 standard deviations (SD) from the WHO Growth Reference population median

Table 11.14 Foods and liquids consumed by women in the day or night preceding the interview

Percentage of women age 15–49 by type of foods and liquids consumed in the day or night preceding the interview, according to background characteristics, Cambodia DHS 2021–22

Background characteristic	Foods made from grains ¹	White/pale starchy roots, tubers, and plantains ²	Beans, peas, lentils ³	Nuts and seeds ⁴	Milk, cheese, yogurt, other milk products	Meat, fish, poultry, organ meats ⁵	Eggs	Dark green leafy vegetables ⁶	Other vitamin A-rich fruits and vegetables ⁷	Other vegetables ⁸	Other fruits ⁹	Insects and other small protein foods ¹⁰	Sweet foods such as chocolates, candies, pastries, cakes, biscuits, ice cream, popsicles	Fried and salty foods such as chips, crisps, puffs, french fries, fried dough	Fruit juice and fruit-flavored drinks	Sodas, malt drinks, sports drinks, and energy drinks	Number of women

¹ Includes rice, Khmer rice pancakes (num banh chhev), glass noodles (kuy teav), bread, Khmer noodles (num banhchok), porridge, and corn

² Includes white potatoes (damlong barain), cassava (damlong cheu), white or purple sweet potatoes (damlong chvea), cassava noodles (damlong mi), taro, local potatoes (damlong daikla), and green bananas

³ Includes soybeans, mung beans (sandek bay), pigeon peas (angkoy bean), red mung beans (sandek krohom), and soy milk

⁴ Includes sandek, sunflower seeds, pumpkin seeds, and watermelon seeds

⁵ Includes liver, kidney, heart, lung, blood, sausages, ham, beef, buffalo, pork, frogs, wild animals, chicken, duck, fish (trey), seafood, eel, small shrimp (kompers), canned fish, and fermented fish (prahok)

⁶ Includes ivy gourd leaves (slek bas), moringa leaves (slek m'rom), green amaranth (slek pty), morning glory, bok choy (speytteu), mustard greens, and pumpkin leaves

⁷ Includes carrots, pumpkin, or sweet potatoes that are yellow or orange inside; ripe mangoes; ripe papayas; passion fruit; sweet leaf bush (slek ngob); cassava leaves; spinach; tree spinach (chaya); kale; and wild greens (slek prech).

⁸ Includes tomato, eggplant, cauliflower (pakakhnha), winter melon (tra lach), long beans, mushrooms and other vegetables

⁹ Includes bananas, oranges, watermelon, rambutan, durian, and other fruit

¹⁰ Includes crickets, bug bacon, snails, spiders, termites, and grasshoppers

¹¹ Includes women who do not know if they are pregnant

Table 11.15 Minimum dietary diversity and unhealthy food and beverage consumption among women

Percentage of women age 15–49 consuming sweet beverages, percentage consuming unhealthy foods, and percentage achieving minimum dietary diversity, according to background characteristics, Cambodia DHS 2021–22

Background characteristic	Minimum dietary diversity ¹	Sweet beverage consumption ²	Unhealthy food consumption ³	Number of women
Age

¹ Minimum dietary diversity for women is defined as consuming foods from five or more of the following 10 food groups: a. grains, white/pale starchy roots, tubers, and plantains; b. pulses (beans, peas, lentils); c. nuts and seeds; d. dairy (milk, cheese, yogurt, other milk products); e. meat, fish, poultry, and organ meats; f. eggs; g. dark green leafy vegetables; h. other vitamin A-rich fruits and vegetables; i. other vegetables; j. other fruits.

² Sweet beverages include fruit juice, fruit drinks, sugarcane juice (tuk ampov), fruit shakes, Coca Cola, Fanta, Sprite, Pepsi, Bacchus, M-150, sweet tea, sweetened coffee, frappes, chocolate frappes, green tea, and other sweetened liquids.

³ Unhealthy foods include sweet foods such as cake, dessert soup, cookies, sweet popcorn, candy (skar krop), chocolate, or ice cream and fried and salty foods such as chips, french fries, and dried noodles such as Mama.

⁴ Includes women who do not know if they are pregnant

Table 11.16 Presence of iodized salt in household

Among all households, percentage with salt tested for iodine content and percentage with no salt in the household, and among households with salt tested, percentage with iodized salt, according to background characteristics, Cambodia DHS 2021–22

Note: Salt was tested for the presence of potassium (iodate/iodide).

Key Findings

- **Nonviolent discipline:** 23% of children age 1–14 experienced nonviolent discipline during the month preceding the interview.
- **Psychological aggression:** About three in every five children (59%) experienced some form of psychological aggression.
- **Physical punishment:** 43% of children experienced physical punishment, and 5% experienced severe physical punishment.
- **Violent discipline:** Overall, 66% of children age 1–14 experienced some type of violent discipline.
- **Belief in the need for physical punishment:** 27% of adult respondents believe that a child needs physical punishment to be raised or educated properly.

Information obtained in the 2021–22 CDHS allows for an assessment of several key aspects of the welfare of Cambodia’s children, including a module on child discipline. These data will help parents and caretakers implement effective disciplinary techniques that make for happy, healthy, and well-behaved children.

12.1 SUB-CLASS AND FORMS OF DISCIPLINARY PRACTICES

Nonviolent disciplinary approaches

Include one or more of the following: (1) taking away privileges, forbidding something the child liked, or not allowing the child to leave the house; (2) explaining that the child’s behavior was wrong; or (3) giving the child something else to do.

Sample: De jure children age 1–14

Psychological aggression

Includes one or both of the following: (1) shouting, yelling, or screaming at the child or (2) calling the child dumb, lazy, or a similar term.

Sample: De jure children age 1–14

Physical punishment

Includes one or more of the following: (1) shaking the child; (2) spanking, hitting, or slapping the child on the bottom with a bare hand; (3) hitting the child on the bottom or other part of the body with a belt, hairbrush, stick, or other similar hard object; (4) hitting the child on the hand, arm, or leg.

Sample: De jure children age 1–14

Severe physical punishment

Includes one or both of the following: (1) hitting or slapping the child on the face, head, or ears or (2) beating the child, that is, hitting the child over and over as hard as one can

Sample: De jure children age 1–14

The manner in which parents and caretakers discipline children can have long-term consequences for their physical and psychological development and well-being. The 2021–22 CDHS Household Questionnaire included questions from the UNICEF Multiple Indicator Cluster Survey (MICS) module on how children in the household are usually disciplined. The questions were asked about one randomly selected child age 1–14 in each household. The respondent to the Household Questionnaire (the household head or other household member) was asked a series of separate questions about disciplinary practices that may have been used with the child during the month before the survey. **Table 12.1** shows the distribution of the 14,196 children age 1–14 selected for the child discipline module by selected background characteristics. The sample was evenly divided between boys and girls (50% each). Thirty-six percent of the children were from urban areas and 65% from rural areas. By province, the largest proportion of children (14%) resided in Phnom Penh, while the smallest proportions resided in Koh Kong, Mondul Kiri, Kep, and Pailin (less than 1% each). Among 14% of children, the mother was not at home during the interview, and among 3% of children the mother was deceased or living elsewhere.

Table 12.2 shows the percentages of children who experienced different types of disciplinary practices during the month prior to the interview. Sixty-three percent of children had privileges taken away; 80% were told why their behavior was wrong; 20% were given something else to do; 53% were shouted, yelled, or screamed at; and 27% were called dumb, lazy, or other names. With respect to physical punishment, 26% of children were spanked, hit, or slapped on the bottom with a bare hand; 17% were hit with a hard object (belt, stick, or hairbrush); 11% were shaken; and 23% of children were hit or slapped on the hand, arm, or leg. Finally, in terms of severe physical punishment, 4% were hit or slapped on the face, head, or ears and 1% were beaten up.

Table 12.3 groups different forms of disciplinary practices into four sub-classes. Twenty-three percent of children age 1–14 experienced only nonviolent discipline, 59% experienced psychological aggression, 43% experienced physical punishment, and 5% experienced severe physical punishment. Overall, 66% of children age 1–14 experienced at least one form of violent discipline.

Patterns by background characteristics

- The use of nonviolent discipline methods increases with increasing household wealth, from 18% in the lowest wealth quintile to 35% in the highest wealth quintile. In contrast, the use of violent discipline methods decreases with increasing wealth, from 74% in the lowest wealth quintile to 55% in the highest quintile (**Table 12.3**).
- The use of nonviolent discipline methods is higher in urban areas than in rural areas (29% versus 20%). Conversely, the use of violent discipline methods is higher in rural areas than in urban areas (71% versus 58%).
- By province, the proportion of children age 1–14 who experienced nonviolent discipline is highest in Phnom Penh (44%) and lowest in Preah Vihear (8%), while the proportion who experienced violent discipline is highest in Kratie (88%) and lowest in Kampong Speu (13%).
- Children of mothers with no education or with only a preschool education are more likely to experience violent discipline (70%) than children of mothers with more than a secondary education (56%).

12.2 BELIEF IN PHYSICAL PUNISHMENT

Belief in physical punishment

Belief that a child needs physical punishment to be raised or educated properly.

Sample: Adult respondents to the Household Questionnaire

Among adults who responded to child discipline questions, more than one quarter (27%) believe that a child needs physical punishment to be raised or educated properly (**Table 12.4**).

Patterns by background characteristics

- A higher percentage of respondents over age 40 (29%) than respondents less than age 40 (24%–26%) believe that a child needs to be physically punished.
- Female respondents are slightly more likely than male respondents to believe that children need to be physically punished (28% versus 25%).
- The proportion of respondents who believe in using a disciplinary method to physically punish children is higher in rural areas than in urban areas (29% versus 23%).
- By province, the proportion of respondents who believe in using physical punishment to properly educate children ranges from less than 1% in Kampong Speu and Koh Kong to 53% in Mondul Kiri.
- Respondents with more than a secondary education are less likely to believe in physical punishment (20%) than those with no education (29%) and those with a primary education (28%).
- The proportion of respondents who believe in using physical punishment to educate children declines with increasing household wealth, from 30% among those in the lowest and second wealth quintiles to 21% among those in the highest wealth quintile (**Table 12.4**).

LIST OF TABLES

For more information on child discipline, see the following tables:

- **Table 12.1 Child discipline sample**
- **Table 12.2 Forms of disciplinary practices**
- **Table 12.3 Sub-class of discipline**
- **Table 12.4 Attitudes toward physical punishment**

Key Findings

- **Discriminatory attitudes:** About one quarter of women and men (26% each) age 15–49 express discriminatory attitudes towards people living with HIV.
- **Using preexposure prophylaxis (PrEP) to prevent getting HIV:** 88% of women and 64% of men age 15–49 have heard of PrEP approve of using it to prevent HIV infection.
- **Sex with nonmarital or noncohabiting partners:** Less than 1% of women and 4% of men reported having sex with a person who neither was their partner nor lived with them in the 12 months preceding the survey.
- **Condom use:** 47% of women and 76% of men reported using a condom during their last sexual intercourse with a nonmarital or noncohabiting partner.
- **Coverage of HIV testing:** 47% of women and 28% of men age 15–49 have ever been tested for HIV and received the test results.

Acquired immunodeficiency syndrome (AIDS) is one of the most serious public health and development challenges facing the world today. AIDS is caused by the human immunodeficiency virus (HIV) when left untreated. HIV weakens the immune system, making the body susceptible to secondary infections and opportunistic diseases. Without treatment, HIV infection leads to AIDS, which is invariably fatal. The predominant mode of HIV transmission is sexual contact. Other modes of transmission include unsafe injections, use of tainted blood supplies during blood transfusions, and mother-to-child transmission (in which the mother passes HIV to her child during pregnancy, delivery, or breastfeeding).

This chapter provides data on levels of and trends in knowledge, attitudes, and behaviors related to HIV and AIDS, including knowledge of HIV prevention methods, stigma and discrimination, sexual behavior, self-reported HIV testing, and prevention of mother-to-child transmission.

13.1 KNOWLEDGE AND ATTITUDES ABOUT MEDICINES TO TREAT OR PREVENT HIV

Antiretroviral medicines, or ARVs, are a powerful tool in the fight against HIV. ARVs are taken by people living with HIV to keep them healthy by preventing the virus from progressing to AIDS. By taking ARVs, individuals living with HIV also greatly reduce the risk of passing the virus on to others. Women living with HIV who take ARVs during pregnancy and breastfeeding reduce the chances of passing the virus on to their children. In addition, people who are HIV negative can take ARVs to reduce their chances of acquiring HIV. When taken daily by people at high risk of being exposed to HIV, this is called preexposure prophylaxis, or PrEP. When taken within 72 hours after a single high-risk exposure and then daily for one month, this is call postexposure prophylaxis, or PEP. Knowledge about and positive attitudes towards these treatment and prevention measures helps to promote their use.

The 2021–22 CDHS asked women and men age 15–49 whether they had heard of HIV or AIDS and a number of questions about whether and how HIV can be avoided. Overall, general awareness of HIV or AIDS among the population is nearly universal, with 96% of women and 97% of men having heard of HIV or AIDS.

Table 13.1 shows that women tend to have greater knowledge of and more favorable attitudes about medicines to treat HIV or prevent HIV transmission than men. Sixty-four percent of women age 15–49 have heard of ARVs that treat HIV, 58% know that the risk of mother-to-child transmission (MTCT) of HIV can be reduced by the mother taking special drugs, and 19% have heard of PrEP. The corresponding percentages among men are 28%, 40%, and 8% (**Figure 13.1**). Sixteen percent of women and 17% of men reported knowing about medicine to be taken within 72 hours after a possible exposure to HIV to reduce the chance of getting infected. Among those who have heard of PrEP, nearly 9 in every 10 women (88%) and 64% of men approve of people who take PrEP to prevent getting HIV.

Trends: The percentage of women who know that the risk of MTCT can be reduced by the mother taking special drugs decreased slightly from 62% in 2014 to 58% in 2021–22. Among men, the percentage decreased from 54% to 40% during the same period (**Figure 13.2**).

Patterns by background characteristics

- Women in urban areas are more likely than those in rural areas to approve of people who take PrEP to prevent HIV infection (93% versus 84%). In contrast, rural men are more likely than their urban counterparts to approve of PrEP use (69% versus 57%).
- Among women, the percentage who approve of taking PrEP for HIV prevention increases with increasing education, from 83% among those with no formal education to 93% among those with more than a secondary education. In contrast, the percentage decreases with increasing education among men (**Table 13.1**).

13.2 DISCRIMINATORY ATTITUDES TOWARDS PEOPLE LIVING WITH HIV

Widespread stigma and discrimination in a population can adversely affect both people's willingness to be tested and their adherence to antiretroviral therapy (ART). Thus, reduction of stigma and discrimination in a population is an important indicator of the success of programs targeting HIV prevention and control.

Figure 13.1 Knowledge of medicines to treat HIV or prevent HIV transmission

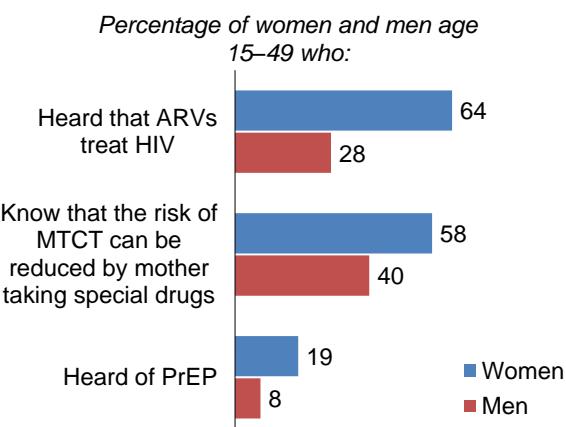

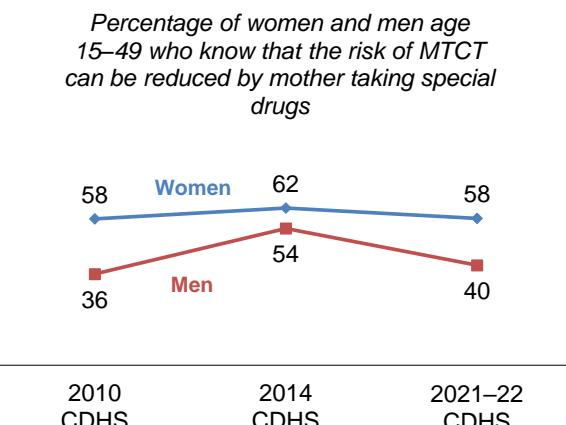

Figure 13.2 Trends in knowledge of mother-to-child transmission (MTCT)

Discriminatory attitudes towards people living with HIV

Women and men are asked two questions to assess discriminatory attitudes towards people living with HIV. Respondents with discriminatory attitudes towards people living with HIV are those who say that they would not buy fresh vegetables from a shopkeeper or vendor if they knew that person had HIV, or who say that children living with HIV should not be allowed to attend school with children who do not have HIV.

Sample: Women and men age 15–49 who have heard of HIV or AIDS

Table 13.2 shows that about one in four women and men age 15–49 who have heard of HIV or AIDS (26% each) have discriminatory attitudes towards people living with HIV.

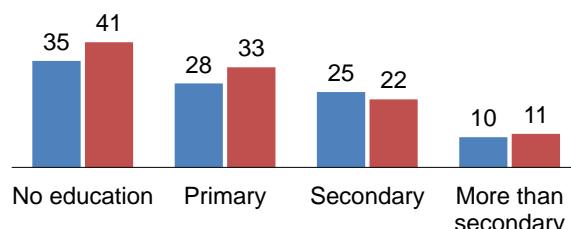

Patterns by background characteristics

- There are differences by residence in discriminatory attitudes towards people living with HIV; only 18% of women and 20% of men in urban areas have discriminatory attitudes, as compared with 32% of women and 31% of men in rural areas.
- Discriminatory attitudes towards people with HIV decrease with increasing education among both women and men; 35% of women and 41% of men with no education have discriminatory attitudes, compared with 10% of women and 11% men with more than a secondary education (**Figure 13.3**).
- Similarly, the percentage of respondents with discriminatory attitudes towards people with HIV decreases with increasing wealth, from 41% among women in the lowest wealth quintile to 16% among those in the highest wealth quintile and from 42% among men in the lowest quintile to 18% among those in the highest quintile.

Figure 13.3 Discriminatory attitudes towards people living with HIV by education

Percentage among women and men age 15–49 who have heard of HIV

■ Women ■ Men

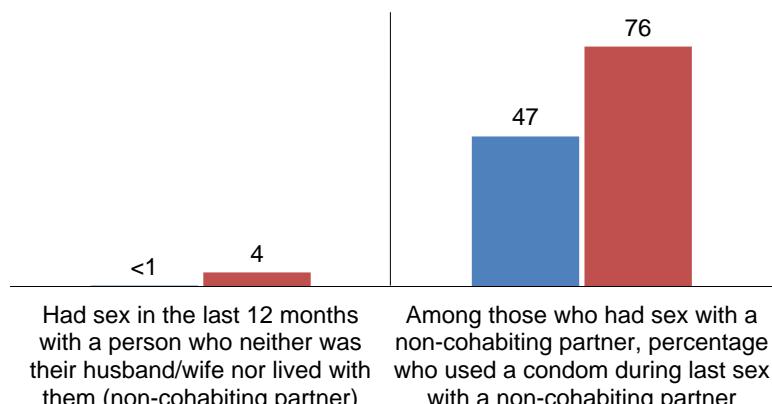

13.3 MULTIPLE SEXUAL PARTNERS

Table 13.3.1 shows that less than 1% of women age 15–49 had two or more sexual partners or had intercourse with a person who neither was their husband nor lived with them in the 12 months preceding the survey. Among women who had two or more sexual partners in the 12 months before the survey, 8% reported using a condom during their last sexual intercourse. Nearly half (47%) of women who had intercourse in the last 12 months with a person who neither was their husband nor lived with them used a

Figure 13.4 Sex and condom use with noncohabiting partners

Percentage of women and men age 15–49

■ Women ■ Men

condom during the last sexual intercourse with such a partner. **Table 13.3.2** shows that 2% of men age 15–49 reported having two or more sexual partners in the 12 months preceding the survey, and 4% had intercourse in the last 12 months with a person who neither was their wife nor lived with them. Among men with two or more sexual partners, 32% used a condom during their last sexual intercourse. Seventy-six percent of men who had intercourse in the last 12 months with a person who neither was their husband nor lived with them used a condom during the last sexual intercourse with such a partner (**Figure 13.4**).

Mean numbers of lifetime sexual partners: women (1.2) and men (4.1).

Patterns by background characteristics

- Men living in urban areas reported a higher number of lifetime sexual partners than those living in rural areas (5.9 versus 2.8).
- The mean number of lifetime sexual partners among men increases with increasing education, from 2.7 among those with no formal education to 6.2 among those with more than a secondary education.
- Men's mean number of lifetime sexual partners also increases with increasing wealth, from 2.3 among those in the lowest wealth quintile to 8.0 among those in the highest wealth quintile.

13.4 COVERAGE OF HIV TESTING SERVICES

HIV testing programs diagnose people living with HIV so that they can be linked to care and access antiretroviral therapy (ART). In addition, knowledge of HIV status helps HIV-negative individuals reduce risk so that they can remain disease free.

13.4.1 HIV Testing of Pregnant Women

Table 13.4 presents information on self-reported HIV testing during pregnancy or delivery among women age 15–49 who gave birth in the 2 years preceding the survey. Sixty-six percent of women received an HIV test and the results during antenatal care (ANC). Seventy-three percent of women had an HIV test during an ANC visit or labor and received the test results.

13.4.2 Experience with Prior HIV Testing

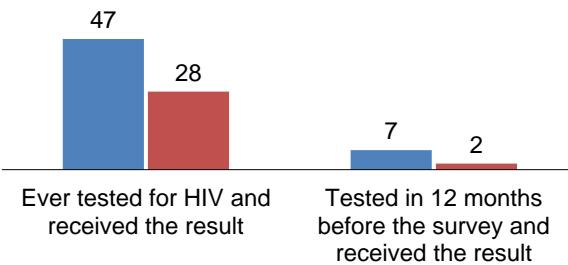

Tables 13.5.1 and **13.5.2** show 47% of women have ever been tested for HIV and received the results, as compared with 28% of men. Only small percentages of women (less than 1%) and men (2%) have been tested but did not receive the test results. Seven percent of women and 2% of men were tested for HIV and received the results in the 12 months preceding the survey (**Figure 13.5**).

Eighteen percent each of women and men reported having been tested only once during their lifetime, and 15% of women and 6% of men report having been tested twice (**Table 13.6**).

Figure 13.5 HIV testing

Percentage of women and men age 15–49

■ Women ■ Men

Trends: The percentage of women age 15–49 who have been tested for HIV and received the results increased from 41% in 2014 to 47% in 2021–22. Among men, this percentage declined from 35% to 28% during the same period (**Figure 13.6**).

Patterns by background characteristics

- A larger percentage of urban women (55%) and men (36%) have been tested for HIV and received the results than their rural counterparts (41% and 22%, respectively).
- By province, the percentage of women who have been tested for HIV and received the results is lowest in Ratanak Kiri (11%) and highest in Pailin (70%). Among men, the percentage is lowest in Kratie (8%) and highest in Pailin (57%).
- The percentage of both women and men who have been tested and received the results increases with increasing wealth, from 39% and 16% among women and men, respectively, in the lowest wealth quintile to 57% and 43% among women and men in the highest quintile (**Figure 13.7**).

Knowledge and Coverage of Self-testing

Only 4% of women and 5% of men age 15–49 have heard of HIV self-test kits, and less than 1% each have ever used a self-test kit (**Table 13.7**).

13.5 DISCLOSURE, SHAME, AND STIGMA AMONG HIV-POSITIVE RESPONDENTS

Internalized and experienced stigma adversely impact the physical and mental health and well-being of people living with HIV and are structural drivers of the HIV epidemic. In the 2021–22 CDHS, respondents who had ever been tested for HIV were asked to report the result of their most recent test. Those who reported having a HIV positive test result were asked a series of questions about their experience living with HIV, including a question on internalized stigma and questions on experience of stigma in community and health care settings. An indicator reflecting experience of stigma in a community setting was calculated from the three questions included on this topic.

All of these indicators are based on the population of people who were aware that they had HIV and who chose to disclose their positive HIV status during the interview. It is important to keep in mind that this group may exclude some respondents who know they have HIV, and results should be interpreted with caution.

Figure 13.6 Trends in HIV testing

Percentage of women and men age 15–49 who have ever been tested for HIV and received the results

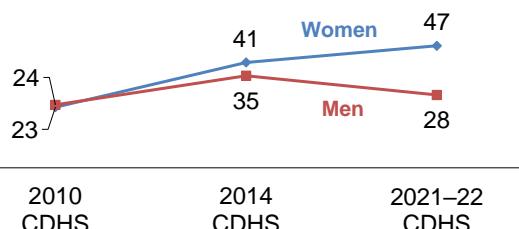

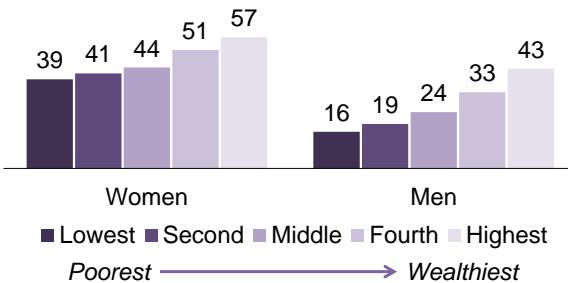

Figure 13.7 HIV testing by household wealth

Percentage of women and men age 15–49 who have ever been tested for HIV and received results

■ Lowest Poorest ■ Second ■ Middle ■ Fourth ■ Highest Wealthiest

→ Wealthiest

Stigma and discrimination experienced in community settings in the last 12 months among people living with HIV

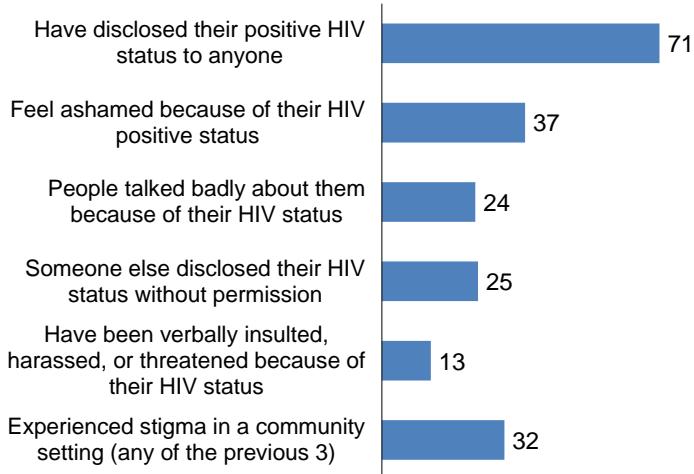

Women and men living with HIV who agreed that they experienced one or more of the following in the last 12 months because of their HIV status: (1) people talked badly about them, (2) someone else disclosed their HIV status without their permission, or (3) they were verbally insulted, harassed, or threatened because of their HIV status.

Sample: Women and men age 15–49 who reported being HIV positive

Only small numbers of women (55 unweighted cases) (**Table 13.8**) and men (11 unweighted cases, data not shown) reported being HIV positive. Among women who reported being HIV positive, 71% have disclosed their positive HIV status to someone, and 37% felt shame because of their positive status. About one in four women living with HIV reported that people talk badly about them because of their HIV status (24%) or that someone else disclosed their HIV status without their permission (25%), and 13% reported that they had been verbally insulted, harassed, or threatened because of their status. Overall, 32% of HIV-positive women reported experiencing stigma in a community setting (**Figure 13.8**).

Figure 13.8 Disclosure, shame, and stigma experienced by people living with HIV

Percentage among women age 15–49 who reported their last HIV test as HIV-positive

13.6 MALE CIRCUMCISION

Traditional circumcision

A cut, partial removal, or complete removal of the foreskin by a traditional practitioner, family member, or friend, for religious, health, or cultural reasons. Can be performed at any age.

Medical circumcision

Complete removal of the foreskin by a health care worker. Can be performed at any age.

Sample: Men age 15–49

All men were asked whether they were circumcised. If they said they were circumcised, they were asked both whether they had been traditionally circumcised and whether they had been medically circumcised, as well as the age at which each procedure had occurred. In some settings, traditional circumcision may leave enough of the foreskin intact that it is possible to perform a medical circumcision afterward, making it possible for a man to have been circumcised both traditionally and medically.

Only 2% of Cambodian men age 15–49 have been circumcised (**Table 13.9**).

Patterns by background characteristics

- By religion, an overwhelming majority of Moslem men (94%) are circumcised. In contrast, only 2% of Christians and less than 1% of Buddhists are circumcised.

- By province, the percentage of circumcised men is highest in Kampong Chhnang (10%) and lowest in Banteay Meanchey, Kampong Speu, Kampong Thom, Ratanak Kiri, and Otdar Meanchey, where less than 0.1% of men reported having been circumcised.

13.7 SELF-REPORTING OF SEXUALLY TRANSMITTED INFECTIONS

Sexually transmitted infections (STIs) and symptoms

Respondents who have ever had sex were asked whether they had an STI or symptoms of an STI (a bad-smelling, abnormal discharge from the vagina/penis or a genital sore or ulcer) in the 12 months before the survey.

Sample: Women and men age 15–49 who have ever had sex

STIs have been found to increase susceptibility to HIV infection (CDC 2014). Overall, 18% of women and 5% of men age 15–49 reported having an STI or symptoms of an STI in the 12 months preceding the survey (**Table 13.10**). The most often reported were a bad-smelling/abnormal genital discharge among women (14%) and an abnormal discharge from the penis among men (2%).

13.8 HIV/AIDS-RELATED KNOWLEDGE AND BEHAVIOR AMONG YOUNG PEOPLE

This section addresses HIV/AIDS-related knowledge among young people age 15–24 and also assesses the extent to which young people engage in behaviors that may place them at risk of contracting HIV.

13.8.1 Knowledge about HIV Prevention

Knowledge about HIV prevention

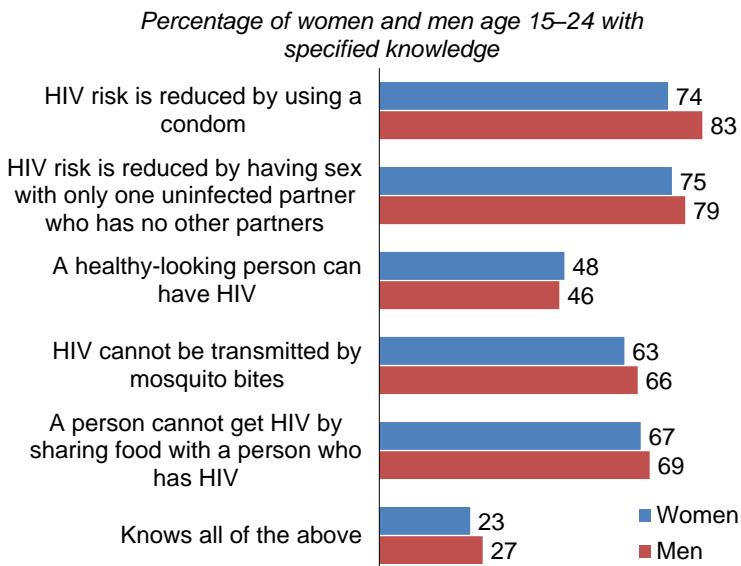

Knowing that consistent use of condoms during sexual intercourse and having just one uninfected faithful partner can reduce the chances of contracting HIV, knowing that a healthy-looking person can have HIV, and rejecting two major misconceptions about HIV transmission: HIV can be transmitted by mosquito bites and a person can become infected by sharing food with a person who has HIV.

Sample: Women and men age 15–24

Knowledge of how HIV is transmitted is crucial to enabling people to avoid HIV infection. This is especially true for young people, who are often at greater risk because they may have shorter relationships with more partners or engage in other risky behaviors.

Figure 13.9 shows the percentages of women and men age 15–24 with specified knowledge about HIV prevention. Twenty-three percent of young women and 27% of young men have comprehensive knowledge about HIV (**Table 13.11.1** and **Table 13.11.2**).

Figure 13.9 Knowledge about HIV prevention among young people

Patterns by background characteristics

- Young women and young men in urban areas (32% and 31%, respectively) are more likely than their counterparts in rural areas (18% and 23%, respectively) to have comprehensive knowledge about HIV.
- By province, the percentage of young women with comprehensive knowledge about HIV ranges from a high of 52% in Kep to a low of less than 0.1% in Ratanak Kiri. Among men, this percentage is lowest in Kampong Thom and Mondul Kiri (2% each) and highest in Pailin (80%).
- The percentage of young women and men with comprehensive knowledge about HIV increases with increasing education. Nine percent of young women with no formal education have comprehensive knowledge, as compared with 41% of those with more than a secondary education. The corresponding percentages among young men are 8% and 49%.
- Comprehensive knowledge about HIV for both young women and young men generally increases with increasing household wealth.

13.8.2 First Sex

Young people who initiate sex at an early age are typically at higher risk of becoming pregnant or contracting an STI than young people who initiate sex later. Consistent condom use can reduce such risks. **Table 13.12** shows that less than 1% each of young women and young men age 15–24 had sex before age 15. Seventeen percent of young women and 5% of young men age 18–24 report that they had sex before age 18.

Patterns by background characteristics

- More young women in rural areas reported having sex before age 18 than their urban counterparts (19% versus 13%). This difference is not observed among men.
- The percentage of young women who reported having sex before age 18 decreases with increasing education, from 51% among those with no education to less than 1% among those with more than a secondary education. The same pattern is observed among young men. The percentage of young women and men who report having sex before age 15 also decreases with increasing education.

13.8.3 Premarital Sex

The 2021–22 CDHS collected information on patterns of sexual activity among never-married young women and men age 15–24. **Table 13.13** shows that among never-married young people, nearly all young women (more than 99%) and 92% of young men have never had sexual intercourse.

13.8.4 Multiple Sexual Partners

Individuals who have multiple sexual partners increase their risk of contracting HIV, because each new relationship introduces another pathway for HIV transmission.

Table 13.14.1 shows that less than 1% of women age 15–24 reported having two or more sexual partners or having sexual intercourse with a partner who neither was their husband nor lived with them in the 12 months preceding the survey.

One percent of men age 15–24 reported having two or more sexual partners in the 12 months preceding the survey (**Table 13.14.2**). Four percent of young men reported having sexual intercourse with a partner who neither was their wife nor lived with them, and among these men 68% reported using a condom during their last sexual intercourse with such a partner.

13.8.5 Recent HIV Testing

Seeking an HIV test may be more difficult for young people than adults because many young people lack experience in accessing health services for themselves and because there are often barriers to young people obtaining services. Overall, among young people age 15–24 who had sexual intercourse in the 12 months preceding the survey, 20% of women and 6% of men were tested for HIV in the 12 months preceding the survey and received the results of their last test (**Table 13.15**).

Trends: HIV testing among young women and men decreased from 25% and 18% in 2014 to 20% and 6% in 2021–22, respectively.

LIST OF TABLES

Table 13.8 Disclosure, shame, and stigma among women living with HIV

Among women age 15–49 who tested HIV positive in the survey and reported the result of their last HIV test as HIV positive, percentage who have ever disclosed their positive HIV status to anyone, percentage who feel ashamed because of their positive HIV status, and percentage who reported experiencing stigma in community and health care settings in the last 12 months due to their HIV status, Cambodia DHS 2021–22

Percentage who have disclosed their positive HIV status to anyone	Percentage who feel ashamed because of their positive HIV status	Experience of stigma in a community setting in the last 12 months among women living with HIV:			Experience of stigma in a health care setting in the last 12 months among women living with HIV:			Number of self-reported HIV-positive women	
		People talked badly about them because of their HIV status	Someone else disclosed their HIV status without their permission	Have been verbally insulted, harassed, or threatened because of their HIV status	Experienced stigma in a community setting ¹	Health care workers talked badly about them because of their HIV status	Were yelled at, scolded, called names, or verbally abused in another way because of their HIV status

¹ Knowledge about HIV prevention means knowing that consistent use of condoms during sexual intercourse and having just one uninfected faithful partner can reduce the chance of getting HIV, knowing that a healthy-looking person can have HIV, and rejecting two major misconceptions about HIV transmission: HIV can be transmitted by mosquito bites and a person can become infected by sharing food with a person who has HIV.

Table 13.11.2 Knowledge about HIV prevention among young people: Men

Percentages of young men age 15–24 who, in response to prompted questions, say that people can reduce their risk of getting HIV by using condoms every time they have sexual intercourse and by having only one uninfected partner who has no other partners, that a healthy-looking person can have HIV, that HIV cannot be transmitted by mosquito bites, and that a person cannot get HIV by sharing food with a person who has HIV, and percentage with knowledge about HIV prevention, according to background characteristics, Cambodia DHS 2021–22

Background characteristic	Percentage who know:							Number of men	
	People can reduce their risk of getting HIV by:					A person cannot get HIV by sharing food with a person who has HIV	Percentage with knowledge about HIV prevention ¹		
	Using a condom every time they have sex	Having sex with only one uninfected partner who has no other partners	A healthy-looking person can have HIV	HIV cannot be transmitted by mosquito bites

¹ Knowledge about HIV prevention means knowing that consistent use of condoms during sexual intercourse and having just one uninfected faithful partner can reduce the chance of getting HIV, knowing that a healthy-looking person can have HIV, and rejecting two major misconceptions about HIV transmission: HIV can be transmitted by mosquito bites and a person can become infected by sharing food with a person who has HIV.

Table 13.12 Age at first sexual intercourse among young people

Key Findings

- **Experience of violence:** 10% of women age 15–49 have experienced physical violence since age 15 and 3% have ever experienced sexual violence by anyone, including less than 1% who have experienced sexual violence by a non-intimate partner.
- **Intimate partner violence:** 21% of women who have ever had an intimate partner have experienced emotional, physical, or sexual violence committed by their current or most recent husband/intimate partner, and 13% experienced such violence in the 12 months prior to the survey.
- **Trends in spousal violence:** The percentage of ever-married women who have experienced spousal physical, sexual, or emotional violence declined from 29% in 2014 to 21% in 2021–22.
- **Violence by any intimate partner in the last 12 months:** 13% of women who have had one or more husbands/intimate partners experienced one or more forms of intimate partner violence in the last 12 months by any husband/intimate partner.
- **Injuries due to spousal violence:** 43% of women who have experienced physical or sexual violence committed by their current or most recent husband/intimate partner have sustained injuries.
- **Help seeking:** 53% of women who have experienced physical or sexual violence by anyone have never sought help or told anyone about the violence.

Gender-based violence against women has been acknowledged worldwide as a violation of basic human rights. Increasing research has highlighted the health burdens, intergenerational effects, and demographic consequences of such violence (United Nations 2006). Gender-based violence has been defined by the United Nations as any act of violence that results in physical, sexual, or psychological harm or suffering to women, girls, men, and boys, as well as threats of such acts, coercion, or the arbitrary deprivation of liberty. This chapter focuses on domestic violence, a form of gender-based violence.

A common form of gender-based violence is intimate partner violence, which refers to behavior within an intimate relationship that causes physical, sexual, or psychological harm, including acts of physical aggression, sexual coercion, psychological abuse, and controlling behaviors. This definition covers violence by both current and former spouses and partners (WHO 2017).

Historically, The DHS Program has collected detailed information only on intimate partner violence experienced by ever-married women, defined as women who are currently married or living with a man as if married and women who were formerly married or lived with a man as if married. More recently, the questionnaire module used to capture intimate partner violence in a DHS survey has been revised to also capture intimate partner violence experienced by never-married women who reported that they currently or formerly had an intimate partner. In the 2021–22 CDHS, the revised version of the domestic violence

questionnaire module was used for the first time, and therefore indicators of intimate partner violence are reported for women who have ever had a husband or other intimate partner. In the context of the revised questionnaire module and this report, the term “boyfriend” excludes anyone reported as an intimate partner.

The 2021–22 CDHS implemented the module of questions on domestic violence in accordance with the World Health Organization’s guidelines on the ethical collection of information on domestic violence (WHO 2001). Thus, only one eligible woman per household was randomly selected for an interview and the module was not implemented if privacy could not be obtained. These restrictions resulted in a total of 7,344 women being successfully interviewed and about 4% of eligible women not being interviewed due to privacy concerns. Specially constructed weights were used to adjust for the selection of only one woman per household and to ensure that the domestic violence subsample was nationally representative.

14.1 MEASUREMENT OF VIOLENCE

Terminology for this chapter

Husband: a man with whom a woman is married or living with as if married.

Intimate partner: a man with whom a never-married woman is in a relationship that involves physical and/or emotional intimacy and for which the relationship is or has the expectation of being longer lasting. As defined for the purposes of this chapter, an intimate partner is not a husband or a man a woman is living with and is also not a boyfriend with whom her relationship is casual or a man with whom she has a one-time encounter.

Husband/intimate partner: the current husband for currently married women; the most recent husband for divorced, separated, or widowed women; the current intimate partner for never-married women who currently have an intimate partner; and the most recent intimate partner for never-married women who do not currently have an intimate partner but had one in the past.

Boyfriend: a man with whom a woman has a casual relationship and who she did not mention as an intimate partner.

In the 2021–22 CDHS, information was obtained from women age 15–49 on their experience of violence committed by any perpetrator, including current and former husbands or other intimate partners. To capture intimate partner violence, ever-married women were asked about their experience of violence committed by their current and former husbands/live-in partners, and, if applicable, never-married women were asked about their experience of violence committed by their current and former intimate partners. More specifically, intimate partner violence was measured by asking women if their current or former husband/intimate partner ever did the following to them:

Physical violence: push you, shake you, or throw something at you; slap you; twist your arm or pull your hair; punch you with his fist or with something that could hurt you; kick you, drag you, or beat you up; try to choke you or burn you on purpose; or attack you with a knife, gun, or other weapon

Sexual violence: physically force you to have sexual intercourse with him when you did not want to, physically force you to perform any other sexual acts you did not want to, or force you with threats or in any other way to perform sexual acts you did not want to

Emotional violence: say or do something to humiliate you in front of others, threaten to hurt or harm you or someone you care about, or insult you or make you feel bad about yourself

In addition to the questions on different forms of intimate partner violence, information was also obtained from all women about physical violence committed by anyone other than any husband/intimate partner

since the respondent was age 15 by asking if anyone had hit, slapped, kicked, or done something else to hurt them physically. Similarly, women were asked about experiences of sexual violence committed by anyone other than any husband/intimate partner by asking if at any time in their life, as a child or as an adult, they were forced in any way to have sexual intercourse or to perform any other sexual acts when they did not want to. Additionally, women who had ever been pregnant were asked about their experience of physical violence during any pregnancy.

14.2 WOMEN'S EXPERIENCE OF PHYSICAL VIOLENCE

Physical violence by any perpetrator

Percentage of women who have experienced any physical violence (committed by a husband, intimate partner, or anyone else) since age 15 and in the 12 months before the survey.

Sample: Women age 15–49

Ten percent of women age 15–49 have experienced physical violence since age 15, and 4% experienced physical violence in the 12 months before the survey (**Table 14.1**).

Trends: The percentage of women who have experienced physical violence since age 15 has decreased by half since 2014, from 20% to 10%. Over the same period, the percentage of women experiencing physical violence in the last 12 months has dropped from 8% to 4%.

Patterns by background characteristics

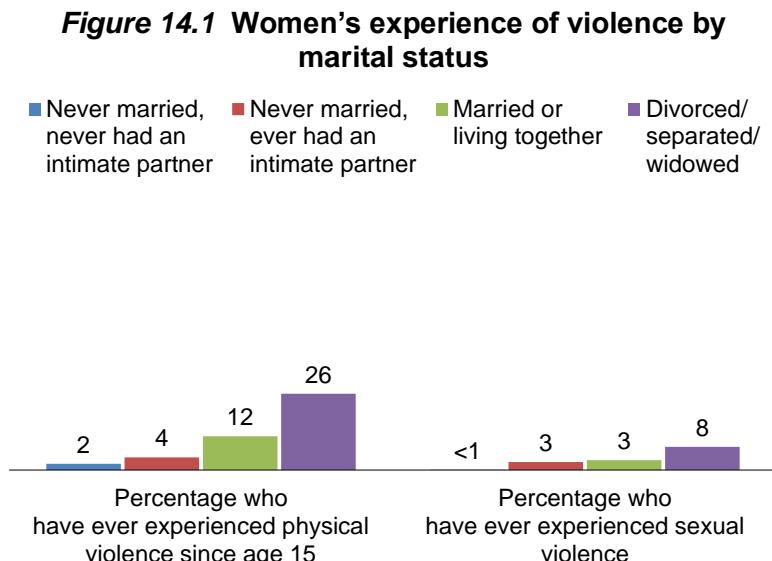

- Experience of physical violence increases with increasing age, from 4% among women age 15–19 to 17% among women age 40–49 (**Table 14.1**).

- The percentage of women who have experienced physical violence since age 15 is lower among those who have never been married (2%) than among those who are currently married (12%) and those who are divorced, separated, or widowed (26%) (**Figure 14.1**).

- By province, women's experience of physical violence ranges from a high of 24% in Mondul Kiri to a low of 4% in Koh Kong.
- Experience of physical violence generally declines with increasing education and household wealth. For example, the percentage of women who have experienced physical violence is 15% among those in the lowest wealth quintile and 6% among those in the highest quintile.

14.2.1 Perpetrators of Physical Violence

Table 14.2 shows perpetrators of physical violence as reported by women who have experienced physical violence since they were age 15. The most commonly reported perpetrators among ever-married/partnered women are current husbands/intimate partners (58%) and former husbands/intimate partners (28%).

Very few women who had never been married and never had an intimate partner reported being victims of physical violence since age 15; nonetheless, the data suggest that family members (parents/stepparents and siblings) are the most frequent perpetrators of physical violence for this group of women.

14.2.2 Experience of Physical Violence during Pregnancy

Physical violence during pregnancy

Percentage of women who have experienced physical violence (committed by a husband, intimate partner, or anyone else) during any pregnancy.

Sample: Women age 15–49 who have ever been pregnant

Among women age 15–49 who have ever been pregnant, 1% have experienced physical violence (committed by a husband, intimate partner, or anyone else) during any pregnancy (**Table 14.3**).

Patterns by background characteristics

- Women with five or more children are more likely to report physical violence during pregnancy than women who have less than five children (**Figure 14.2**).
- The percentage of women who have experienced physical violence during pregnancy is higher among those with no formal education (3%) than among those in any other education category (less than 2%).

Figure 14.2 Experience of physical violence during pregnancy by number of living children

Percentage who experienced physical violence when pregnant among women age 15–49 who have ever been pregnant

14.3 EXPERIENCE OF SEXUAL VIOLENCE

Sexual violence by any perpetrator

Percentage of women who have experienced any sexual violence (committed by a husband, intimate partner, or anyone else) ever and in the 12 months before the survey.

Sample: Women age 15–49

14.3.1 Prevalence of Sexual Violence

Three percent of women age 15–49 have ever experienced sexual violence, and 2% experienced sexual violence in the 12 months before the survey (**Table 14.4**).

Trends: The percentage of women who have ever experienced sexual violence declined from 6% in 2014 to 3% in 2021–22.

Patterns by background characteristics

- The percentage of women who have ever experienced sexual violence increases with age. Less than 1% of women age 15–19 report ever experiencing sexual violence, as compared with 5% of women age 40–49.
- Divorced/separated/widowed women are more likely to have experienced sexual violence (8%) than women who are married/living with a partner (3%), women who have never been married but have

had an intimate partner (3%), and women who have never been married and never had an intimate partner (less than 1%) (**Figure 14.1**).

- By province, the percentage of women who have experienced sexual violence ranges from a high of 10% in Preah Vihear to a low of less than 1% in Pursat and Otdar Meanchey.
- Experience of sexual violence generally decreases with increasing education and household wealth.

14.3.2 Perpetrators of Sexual Violence

Table 14.5 shows that the most common perpetrators of sexual violence reported by women who have ever been married or lived with a partner or who have never been married but have had an intimate partner are current husbands/intimate partners (70%) and former husbands/intimate partners (26%). Six percent of women also mention in-laws as perpetrators of sexual violence.

14.3.3 Experience of Sexual Violence by a Non-intimate Partner

Table 14.6 shows that very few women (less than 1%) reported ever having experienced any sexual violence by a non-intimate partner. Sexual violence by a non-intimate partner is highest (3%) among women in Pailin province and among never-married women who have ever had an intimate partner. In all other categories of women, the percentage who have experienced sexual violence by a non-intimate partner is 1% or less. No women reported experiencing sexual violence by a non-intimate partner in the 12 months prior to the survey.

14.3.4 Age at First Experience of Sexual Violence

Among all women, about 2 in 1,000 experienced sexual violence by any perpetrator before age 15, and 5 in 1,000 experienced sexual violence by age 18. When perpetrators were restricted to non-intimate partners, 2 in 1,000 women reported experiencing sexual violence from such a partner by age 18 (**Table 14.7**).

14.4 EXPERIENCE OF DIFFERENT FORMS OF VIOLENCE

Women may experience a combination of different forms of violence. Overall, 11% of women age 15–49 have experienced physical or sexual violence or both. Eight percent of women have experienced only physical violence, 1% have experienced only sexual violence, and 2% have experienced both physical and sexual violence (**Table 14.8**).

14.5 FORMS OF CONTROLLING BEHAVIORS AND INTIMATE PARTNER VIOLENCE

Controlling behavior

Percentage of women whose current or most recent husband or intimate partner demonstrates one or more of the five specified controlling behaviors.

Sample: Women age 15–49 who ever had a husband or an intimate partner

Intimate partner violence

Percentage of women who have experienced any of the specified acts of physical, sexual, or emotional violence committed by their current or most recent husband or intimate partner, ever and in the 12 months preceding the survey.

Sample: Women age 15–49 who have ever had a husband or an intimate partner

14.5.1 Prevalence of Controlling Behaviors and Intimate Partner Violence

Controlling Behaviors

Attempts by husbands or intimate partners to closely control and monitor their wives'/intimate partners' behavior are important warning signs and correlates of violence in a relationship. Because the concentration of behaviors is more significant than the display of any single behavior, the proportion of women whose husbands/intimate partners display at least three such behaviors is also an important indicator.

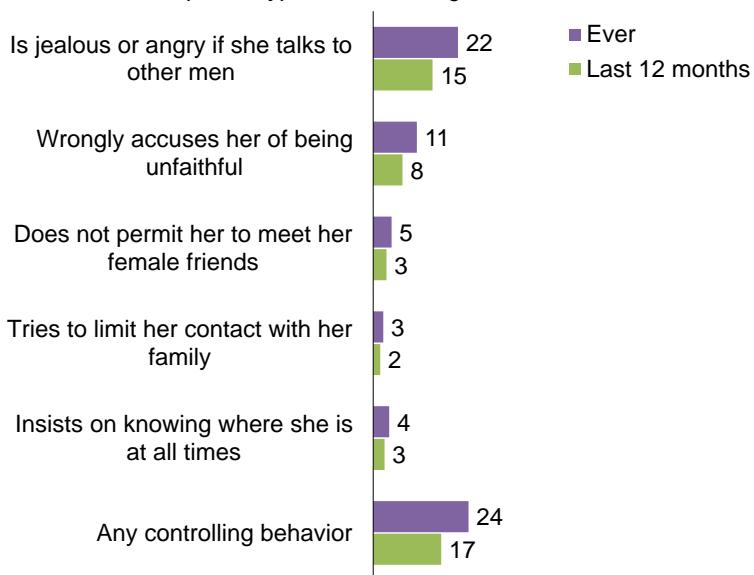

Twenty-four percent of women who have ever had a husband or intimate partner reported that their husband/intimate partner demonstrated at least one of the specified behaviors and 5% reported that he demonstrated at least three of the specified controlling behaviors. Women were most likely to report that their husband/partner is jealous or angry if they talk to other men (22%) and that he wrongly accuses them of being unfaithful (11%) (**Table 14.9** and **Figure 14.3**).

Patterns of controlling behaviors by background characteristics

- By province, the percentage of women reporting that their husband/intimate partner displays three or more of the specified behaviors is highest in Kampong Chhnang (10%) and lowest in Koh Kong (1%) (**Table 14.10**).
- Two percent of women who have never been married but currently have an intimate partner report that their partner demonstrates three or more controlling behaviors, as compared with 4% of women who are currently married or living with a man as if married and 11% of women who are divorced, separated, or widowed.
- The percentage of women whose husband/intimate partner demonstrates controlling behaviors tends to decline with women's education and household wealth.
- Women who are afraid of their husband/intimate partner are more likely to experience controlling behaviors than women who are not afraid of their husband/intimate partner. About one in three (34%) women who are afraid of their husband/intimate partner most of the time reported experiencing at least three forms of controlling behaviors, compared with 3% of women who are never afraid of their husband/intimate partner.

Figure 14.3 Forms of controlling behaviors

Percentage women age 15–49 who have ever had a husband or intimate partner and have experienced specific types of controlling behaviors

Violence by Current or Most Recent Husband/Intimate Partner

Twenty-one percent of women who have ever had a husband or an intimate partner have ever experienced emotional, sexual, or physical violence from their current or most recent husband or intimate partner, and 13% experienced such violence in the last 12 months (**Table 14.9** and **Figure 14.4**).

The most common acts of intimate partner physical violence experienced by women are being pushed, shaken, or having something thrown at them and being slapped (6% each). Three percent of women reported having their arm twisted or hair pulled, and 2% each reported being kicked, dragged, or beaten up and being punched by their husband/intimate partner with his fist or with something else that could hurt them. One percent each of women said that their husband/intimate partner had attacked them with a knife, gun, or other weapon and had tried to choke or burn them on purpose.

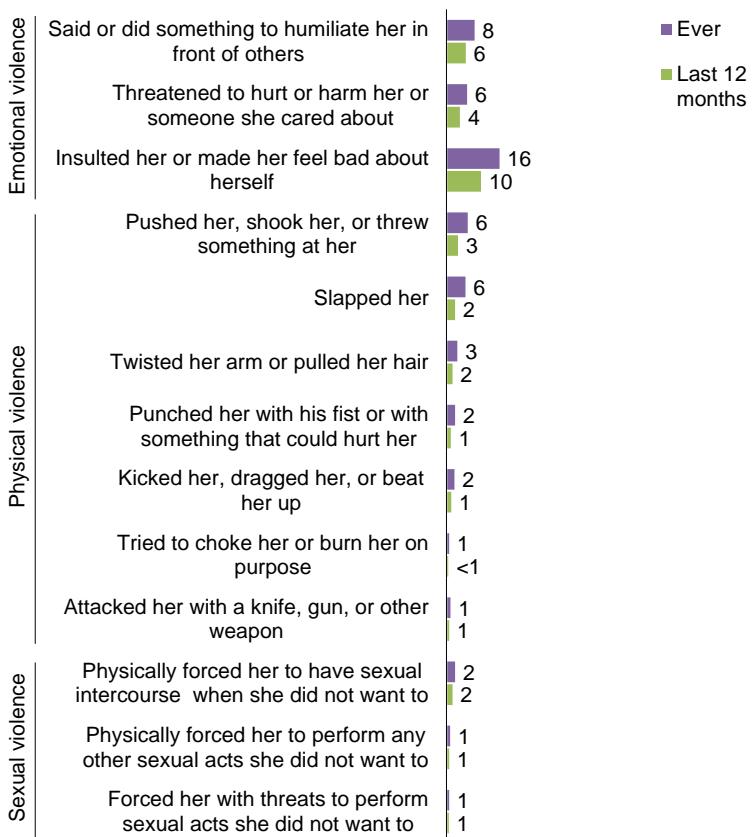

Three percent of women who have ever had a husband or intimate partner reported experiencing sexual violence from their current or most recent husband/intimate partner. Women most commonly reported that their husband/intimate partner used physical force to have sexual intercourse with them when they did not want to (2%). One percent each of women reported that their husband/intimate partner physically forced them to perform other sexual acts they did not want to and forced them with threats or in other ways to perform sexual acts they did not want to.

Nineteen percent of women who have ever had a husband or intimate partner reported experiencing emotional violence from their current or most recent husband/intimate partner. Women were most likely to report that their husband/intimate partner insulted them or made them feel bad about themselves (16%) and said or did something to humiliate them in front of others (8%). Six percent of women said that their husband/intimate partner threatened to hurt or harm them or someone close to them.

Women who had been married or cohabited with a man more than once and never-married women who had had more than one intimate partner were also asked about their experience of physical, sexual, or emotional violence by any previous husband or intimate partner. When violence by any husband/intimate partner is included in the estimate of the prevalence of physical, sexual, or emotional intimate partner violence among women who have ever had one or more husbands or intimate partners, the prevalence increases slightly to 22% (**Table 14.9**).

Figure 14.4 Forms of intimate partner violence

Percentage of women age 15–49 who have ever had a husband or intimate partner and have ever experienced specific acts of violence by their husband/intimate partner

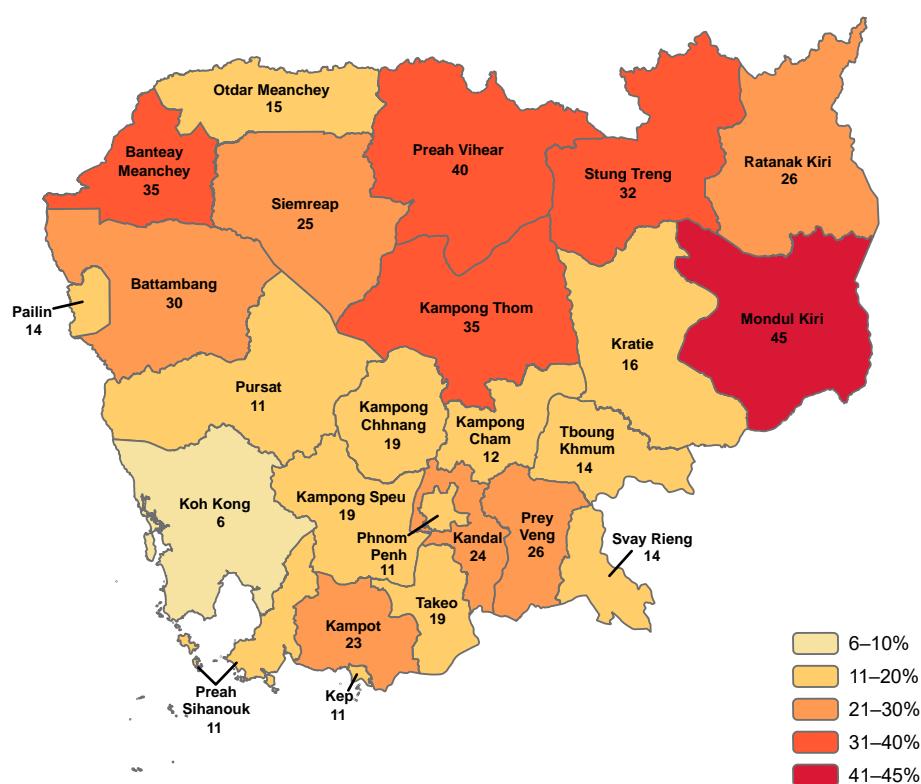

Trends: Among ever-married women, the prevalence of all forms of violence by their current or most recent husband/partner is lower in 2021–22 than in 2014. Overall, the prevalence of spousal physical, sexual, or emotional violence perpetrated by women’s current or most recent husband/partner declined from 29% in 2014 to 21% in 2021–22 (**Table 14.11**).

Patterns of intimate partner violence perpetrated by the current or most recent husband/intimate partner by background characteristics

- The percentage of women who have ever experienced one or more forms of intimate partner violence generally increases with age (**Table 14.11**).
- Women in rural areas are more likely than their urban counterparts (23% versus 17%) to have experienced physical, sexual, or emotional violence by their current or most recent husband/intimate partner.
- By province, the percentage of ever-married women who have experienced physical, sexual, or emotional violence by their current or most recent intimate partner is lowest in Koh Kong (6%) and highest in Mondul Kiri (45%) (**Map 14.1**).
- Thirty-eight percent of divorced/separated/widowed women have experienced physical, sexual, or emotional violence by their current or most recent intimate partner, as compared with 20% of currently married/partnered women and 8% of never-married women who currently have an intimate partner.
- The percentage of women who have experienced physical, sexual, or emotional violence by their current or most recent intimate partner generally decreases with increasing education and household wealth.

Map 14.1 Intimate partner violence by province

Percentage of women age 15–49 who have ever had a husband or intimate partner and have ever experienced physical, sexual, or emotional violence committed by their husband/intimate partner

Patterns of intimate partner violence perpetrated by the current or most recent husband/intimate partner by husband's/intimate partner's characteristics and women's empowerment indicators

- Women are much more likely to experience intimate partner violence if their husband/intimate partner drinks alcohol. Fifty percent of women whose husbands/intimate partners drink alcohol and are often drunk and 17% of women whose husbands/intimate partners drink alcohol and are sometimes drunk have experienced physical, sexual, or emotional intimate partner violence, as compared with 9% of women whose husbands/intimate partners do not drink alcohol (**Table 14.12** and **Figure 14.5**).
- The percentage of women who have experienced intimate partner violence declines with increasing husband's/intimate partner's education, from 33% among women whose husbands/intimate partners have no education to 8% among women whose husbands/intimate partners have more than a secondary education.
- Women's experience of intimate partner violence increases sharply with the number of marital control behaviors exhibited by their husbands/intimate partners. Twelve percent of women whose husbands/intimate partners exhibit no controlling behaviors have experienced physical, sexual, or emotional intimate partner violence, compared with 75% of women whose husbands/intimate partners exhibit three or four controlling behaviors.
- Intergenerational effects of intimate partner violence are evident in Cambodia. Women who report that their fathers beat their mothers are more likely (33%) to have themselves experienced physical, sexual, or emotional intimate partner violence than women who report that their fathers did not beat their mothers (18%).
- Women who are afraid of their husbands/intimate partners most of the time are much more likely to have experienced intimate partner violence (76%) than women who are never afraid of their husbands/intimate partners (15%).

14.5.2 Intimate partner violence in the last 12 months perpetrated by any husband/intimate partner

Intimate partner violence by any partner in the last 12 months

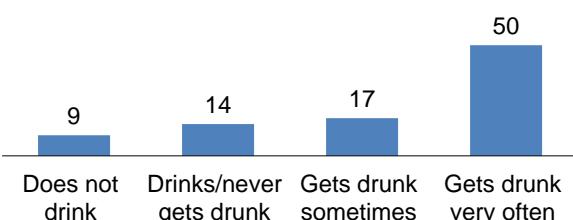

Percentage of women who experienced any of the specified acts of physical, sexual, or emotional violence committed by any husband or intimate partner in the 12 months preceding the survey. These indicators correspond to SDG 5.2.1.

Sample: Women age 15–49 who have ever had a husband or an intimate partner

Thirteen percent of women who have ever had one or more husbands/intimate partners experienced physical, sexual, or emotional violence in the 12 months before the survey from any husband/intimate partner, including 4% who experienced physical intimate partner violence, 2% who experienced sexual intimate partner violence, and 12% who experienced emotional intimate partner violence (**Table 14.13**).

Figure 14.5 Intimate partner violence by husband's/intimate partner's alcohol consumption

Percentage of women who have ever had a husband or intimate partner and have ever experienced emotional, physical, or sexual violence by their husband/intimate partner

Patterns of intimate partner violence by any husband/intimate partner by background characteristics

- The likelihood of violence by any husband/intimate partner in the last 12 months increases with women's age; 9% of women age 15–19 reported experiencing physical, sexual, or emotional violence by any husband/intimate partner, as compared with 17% of women age 40–49.
- Sixteen percent of women in rural areas reported experiencing any form of intimate partner violence in the last 12 months from any husband/intimate partner, compared with 9% of women in urban areas.
- Women's likelihood of experiencing intimate partner violence by any husband/intimate partner in the last 12 months declines sharply with increasing education and household wealth. The percentage of women who experienced physical, sexual, or emotional violence from any husband/intimate partner in the last 12 months decreases from 20% among those with no education to 3% among those with more than a secondary education. Similarly, the percentage of women who experienced physical, sexual, or emotional violence from any husband/intimate partner decreases from 22% among those in the lowest wealth quintile to 6% among those in the highest wealth quintile.

14.6 INJURIES TO WOMEN DUE TO INTIMATE PARTNER VIOLENCE

Injuries due to intimate partner violence

Percentage of women who have the following types of injuries from intimate partner violence: cuts, bruises, or aches; eye injuries, sprains, dislocations, or burns; or deep wounds, broken bones, broken teeth, or any other serious injury.

Sample: Women age 15–49 who have experienced physical or sexual violence committed by their current or most recent husband or intimate partner

Forty-three percent of women age 15–49 who have ever had a husband/intimate partner and have ever experienced physical or sexual violence committed by their current or most recent husband/intimate partner reported that they sustained injuries as a result of the violence, and 46% of women who experienced such violence in the last 12 months reported an injury (**Table 14.14**).

The most commonly reported injuries were cuts, bruises, or aches (41%), followed by eye injuries, sprains, dislocations, or burns (16%) and deep wounds, broken bones, broken teeth, or any other serious injury (4%). The different types of injuries were even more common among women who had experienced physical or sexual intimate partner violence in the last 12 months.

14.7 VIOLENCE INITIATED BY WOMEN AGAINST HUSBANDS OR INTIMATE PARTNERS

Initiation of physical violence by women

Percentage of women who have ever hit, slapped, kicked, or done anything else to physically hurt their current or most recent husband or intimate partner at times when he was not already beating or physically hurting them.

Sample: Women age 15–49 who have ever had a husband or an intimate partner

Six percent of women who have ever had a husband or intimate partner have ever committed physical violence against their current or most recent husband/intimate partner when he was not already beating or physically hurting them. Four percent of women reported having committed physical violence against their husband/intimate partner in the 12 months prior to the survey (**Table 14.15** and **Table 14.16**).

Trends: The percentage of ever-married women who have committed physical violence against their current or most recent husband/intimate partner decreased from 9% in 2014 to 6% in 2021–22.

Patterns by background characteristics

- Women who have experienced physical intimate partner violence are much more likely to commit physical violence against their current or most recent husband/intimate partner than those who have never experienced physical intimate partner violence (39% versus 3%).
- The distribution by background characteristics of women who have committed physical violence against their husbands/intimate partners follows a pattern similar to women's own experience of such violence (see **Tables 14.11** and **14.12**). This is not surprising given that the vast majority of women who commit acts of physical violence against their husbands/intimate partners are those who have themselves experienced intimate partner violence.

14.8 HELP SEEKING AMONG WOMEN WHO HAVE EXPERIENCED VIOLENCE

Women who have experienced physical or sexual violence by anyone tend not to seek help or tell anyone about the violence. Only 31% of women who have ever experienced any physical or sexual violence sought help, and 16% did not seek help but did tell someone about the violence. More than half of women (53%) who experienced any physical or sexual violence neither sought help nor told anyone about the violence (**Table 14.17**).

Patterns by background characteristics

- Women who have experienced both physical and sexual violence are more likely to have sought help (54%) than women who have experienced only physical violence (26%) or only sexual violence (25%) (**Figure 14.6**).
- Women age 15–19 who have experienced physical or sexual violence are much less likely (10%) than older women (29%–41%) to seek help.
- Help seeking varies inconsistently with education and household wealth.

Sources for Help

Women who have experienced physical or sexual violence and sought help are most likely to ask for help from their own family (59%), followed by the police (21%), village/commune chief (20%), neighbors (14%), and their husband's/partner's family (11%) (**Table 14.18**).

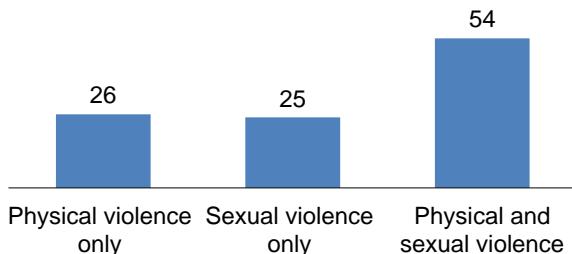

14.9 INTIMATE PARTNER VIOLENCE DURING THE COVID-19 PANDEMIC

The 2021–22 CDHS included two additional questions designed to provide a better understanding of the effects on women's experience of intimate partner violence of the COVID-19 pandemic, which began in most of the world in early 2020. The first question asked women who had experienced any physical or sexual intimate partner violence from any husband/intimate partner when the violence began in relation to the pandemic, and the second question asked them whether their husband's/intimate partner's violent behaviors became worse, became better, or remained the same after the start of the COVID-19 pandemic.

Fifty-four percent of women who had experienced physical or sexual violence from any husband/intimate partner reported that the violence began before the pandemic, while 36% reported that some of the violence began before and some after the pandemic started and 10% reported that the violence began during the pandemic (**Table 14.19**). Furthermore, 76% of women said that their husband's/intimate

Figure 14.6 Help seeking by type of violence experienced

Percentage of women age 15–49 who have experienced physical or sexual violence and sought help

partner's violent behaviors became better after the start of the pandemic, 19% said that they remained the same, and 6% said that they became worse. While there is limited variation in these proportions by most background characteristics, women age 20–24 and 25–29 were more likely (87% and 83%, respectively) to say that the violence became better after the start of the pandemic than women age 30–39 (73%) and 40–49 (74%).

Among women age 15–49 who have experienced sexual violence, percentage who report specific persons who committed the violence, according to the respondent's partnership status, Cambodia DHS 2021–22

Person	Partnership status		
	Ever married/ ever had intimate partner	Never married/ never had intimate partner	Total
Current husband/intimate partner	69.5	na	69.2
Former husband/intimate partner	25.9	na	25.8
Current/former boyfriend	1.2	*	1.3
Brother/stepbrother	0.6	*	0.6
In-law	5.7	na	5.9
Own friend/acquaintance	0.1	*	0.1
Schoolmate/classmate	1.3	*	1.3
Police/soldier	0.4	*	0.4
Priest/religious leader	1.8	*	1.7
Other	0.3	*	0.4
Number of women who have experienced sexual violence	217	1	218

Notes: The term husband includes a partner with whom a woman is living as if married. Percentages may add to more than 100% since women can report more than one perpetrator. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

na = not applicable

Table 14.6 Experience of sexual violence by any non-intimate partner

Percentage of women age 15–49 who have ever experienced sexual violence by someone who is not a husband or intimate partner, and percentage who experienced sexual violence by someone who is not a husband or intimate partner in the 12 months preceding the survey, according to background characteristics, Cambodia DHS 2021–22

Table 14.9 Forms of controlling behaviors and intimate partner violence

Percentage of women age 15–49 who have ever had a husband or intimate partner and have experienced controlling behaviors and various forms of intimate partner violence ever or in the 12 months preceding the survey perpetrated by a husband or intimate partner, Cambodia DHS 2021–22

Type of controlling behavior or violence experienced	Ever experienced	Experienced in the last 12 months	Frequency in the last 12 months	
			Often	Sometimes
Controlling behavior				
Any controlling behavior	24.4	17.4	4.7	12.7
Is jealous or angry if she talks to other men	21.7	15.2	3.5	11.7
Wrongly accuses her of being unfaithful	11.2	7.5	2.5	5.0
Does not permit her to meet her female friends	4.7	3.4	1.2	2.2
Tries to limit her contact with her family	2.6	1.8	0.8	1.1
Insists on knowing where she is at all times	4.1	2.9	1.1	1.8
Physical violence				
Any physical violence	8.7	4.4	1.5	2.9
Pushed her, shook her, or threw something at her	6.3	3.3	1.0	2.3
Slapped her	5.6	2.4	0.6	1.8
Twisted her arm or pulled her hair	3.1	1.6	0.4	1.2
Punched her with his fist or with something that could hurt her	2.4	1.1	0.3	0.8
Kicked her, dragged her, or beat her up	2.2	1.2	0.5	0.7
Tried to choke her or burn her on purpose	0.6	0.3	0.2	0.1
Attacked her with a knife, gun, or other weapon	1.0	0.6	0.3	0.3
Sexual violence				
Any sexual violence	2.6	1.9	0.7	1.2
Physically forced her to have sexual intercourse with him when she did not want to	2.4	1.6	0.6	1.1
Physically forced her to perform any other sexual acts she did not want to	0.9	0.6	0.2	0.4
Forced her with threats or in any other way to perform sexual acts she did not want to	0.6	0.5	0.2	0.3
Emotional violence				
Any emotional violence	18.7	12.2	3.0	9.2
Said or did something to humiliate her in front of others	8.4	5.7	1.6	4.1
Threatened to hurt or harm her or someone she cared about	6.1	3.9	1.4	2.5
Insulted her or made her feel bad about herself	16.1	10.4	2.6	7.8
At least three forms of controlling behaviors	4.7	3.5	2.4	1.1
Any form of physical and/or sexual violence	9.9	5.3	1.8	3.5
Any form of emotional and/or physical and/or sexual violence	20.7	13.2	3.3	9.9
Intimate partner violence perpetrated by any current or previous husband or intimate partner				
Physical violence	10.2	4.4	na	na
Sexual violence	3.4	1.9	na	na
Emotional violence	20.1	12.2	na	na
Any form of physical or sexual violence	11.6	5.4	na	na
Any form of emotional or physical or sexual violence	22.4	13.2	na	na
Number of women who have ever had a husband or intimate partner	5,780	5,780	5,780	5,780

Note: The term husband includes a partner with whom a woman is living as if married. Husband/intimate partner refers to the current husband for currently married women; the most recent husband for divorced, separated, or widowed women; the current intimate partner for never-married women who currently have an intimate partner; and the most recent intimate partner for never-married women who do not currently have an intimate partner but had one in the past.

na = not available

Table 14.10 Controlling behaviors of husband/intimate partner by background characteristics

Percentage of women age 15–49 who have ever had a husband or intimate partner whose husband/intimate partner has ever demonstrated specific types of controlling behaviors, according to background characteristics, Cambodia DHS 2021–22

Background characteristic	Percentage of women whose husband/intimate partner:								Number of women who ever had a husband/intimate partner
	Is jealous or angry if she talks to other men	Wrongly accuses her of being unfaithful	Does not permit her to meet her female friends	Tries to limit her contact with her family	Insists on knowing where she is at all times	Does not trust her with money	Displays 3 or more of the specific behaviors	Displays none of the specific behaviors

Key Findings

- **Women's control over their cash earnings:** 97% of currently married women age 15–49 who receive cash earnings for their employment participate in making decisions about the use of their earnings, and 63% make these decisions mainly alone.
- **Ownership of a house and land:** House and land ownership is higher among women than men but has declined since 2014.
- **Bank accounts and mobile phones:** 22% of women age 15–49 have and use a bank account for financial transactions; 85% own a mobile phone, including 78% who own a smartphone; and 29% have and use a bank account or used a mobile phone for financial transactions in the 12 months preceding the survey.
- **Women's participation in decision making:** Overall, 88% of currently married women age 15–49 participate either alone or jointly with their partner in decisions regarding their own health care, major household purchases, and visits to their family and relatives.
- **Attitudes toward wife beating:** 37% of women and 16% of men agree that a husband is justified in hitting or beating his wife under one or more specified circumstances. Both of these percentages have decreased since 2014.
- **Negotiating sexual relations:** 91% of currently married women can say no to their husband if they do not want to have sexual intercourse, and 81% can ask their husband to use a condom.
- **Informed decision making about sexual and reproductive health:** 80% of currently married women can say no to their husband if they do not want to have sexual intercourse, participate in making decisions about the use of family planning, and participate in making decisions about their own health care.

This chapter explores women's empowerment in Cambodia using indicators that measure different dimensions of empowerment. Wherever relevant, comparable indicators for men are also presented. The indicators discussed are employment and control over earnings, ownership of assets (including houses, land, and mobile phones), use of bank accounts and mobile money services, participation in household decision making, attitudes toward wife beating, negotiation of safe sex, and participation in decision making regarding sexual and reproductive health.

15.1 MARRIED WOMEN'S AND MEN'S EMPLOYMENT

Employment

Respondents are considered to be employed if they have done any work other than their housework in the 12 months before the survey.

Sample: Currently married women and men age 15–49

Earning cash for employment

Respondents are asked if they are paid for their labor in cash or in-kind. Only those who receive payment in cash only or in cash and in-kind are considered to earn cash for their employment.

Sample: Currently married women and men age 15–49 employed in the 12 months before the survey

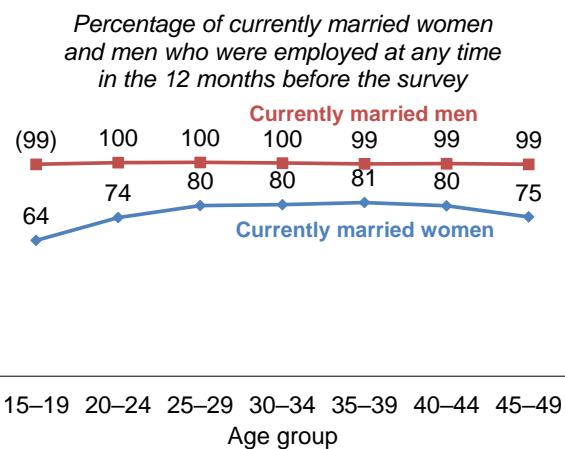

Seventy-nine percent of currently married women age 15–49 were employed in the 12 months before the survey, as compared with nearly all currently married men (**Table 15.1**). Employed women are somewhat more likely than employed men to be paid only in cash for their work (85% versus 82%). Five percent of women and 2% of men who were employed in the last 12 months were not paid for their work.

Trends: The percentage of currently married women employed in the 12 months before the survey decreased by 2 percentage points between 2014 and 2021–22, from 81% to 79%. However, the percentage of currently married men employed in the 12 months before the survey remained unchanged at almost 100% during the same period.

Patterns by background characteristics

- Among currently married women, the percentage employed increases from 64% among those age 15–19 to 81% among those age 35–39 and then drops to 75% among those age 45–49 (**Figure 15.1**).
- The percentage of employed married women who earn cash does not vary extensively by age but is highest among women age 25–29 (95%) and lowest among women age 45–49 (86%).

Figure 15.1 Employment by age

Figures in parentheses are based on fewer than 50 cases.

15.2 CONTROL OVER WOMEN'S EARNINGS

Control over one's own cash earnings

Respondents are considered to have control over their own earnings if they participate in decisions alone or jointly with their spouse about how their own earnings will be used.

Sample: Currently married women and men age 15–49 who received cash earnings for employment during the 12 months before the survey

Women have direct access to economic resources when they are employed for cash. However, this access may not be empowering for women unless they also control how their earnings are used. Overall, 63% of women reported that they mainly decide how to use their cash earnings, while 35% reported that they make such decisions jointly with their husband and 3% said that their husband is the main decision maker on how to use their earnings (**Table 15.2.1** and **Figure 15.2**).

Sixteen percent of women who earn cash earn more than their husbands, 39% earn less than their husbands, and 44% earn about the same as their husbands (**Table 15.2.1**).

Trends: The percentage of married women who decide mainly alone on the use of their cash earnings decreased from 74% in 2014 to 63% in 2021–22. However, during the same period, the percentage of women who make such decisions jointly with their husbands increased from 25% to 35%; thus, women’s participation in deciding how their earnings are used remained almost unchanged between 2014 (98%) and 2021–22 (97%). In this same period, the percentage of women with cash earnings who earn more than their husbands remained unchanged at 16%, but the percentage who earn about the same as their husbands increased from 35% to 44%.

Patterns by background characteristics

- The percentage of women whose husband mainly makes decisions about the use of their earnings ranges from less than 0.1% in Kampong Cham, Svay Rieng, Kep, and Tboung Khmum to 17% in Otdar Meanchey.
- The percentage of women who report that their husband mainly makes decisions regarding their earnings declines with increasing education and household wealth.
- The percentage of women who earn less than their husband generally declines with age, from 54% among those age 15–19 to 31% among those age 45–49 (**Table 15.2.1**).
- Rural women with cash earnings are more likely than their urban counterparts to earn less than their husband (43% versus 33%).
- The percentage of women who earn less than their husband generally declines with increasing education and household wealth. For example, 49% of women in the lowest wealth quintile earn less than their husband, as compared with 33% of women in the highest wealth quintile.

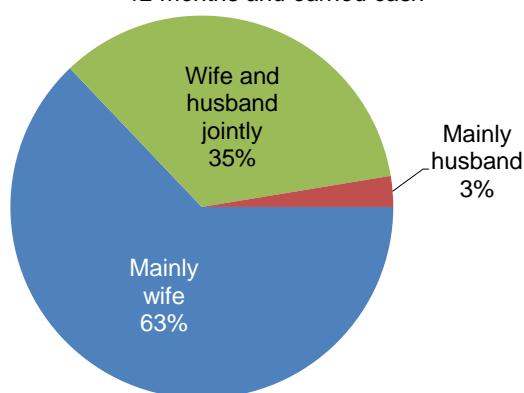

15.3 CONTROL OVER MEN’S EARNINGS

Married men with cash earnings were asked about who makes decisions regarding how their earnings are used. Among currently married men age 15–49 who receive cash earnings, 48% reported that they make decisions about the use of their earnings jointly with their wives, 46% said that their wives mainly make these decisions, and only 6% said that they mainly make these decisions on their own (**Table 15.2.2**).

Currently married women whose husbands had earnings were also asked about control over their husbands’ earnings. Overall, 52% of women said that they themselves mainly decide how their husband’s earnings are used, 43% said that these decisions are made jointly with their husband, and 6% said that their

Figure 15.2 Control over women’s earnings

Percent distribution of currently married women who were employed in the last 12 months and earned cash

husband makes these decisions mainly by himself. Thus, women are more likely than men to say that the wife mainly makes decisions about the use of the husband's earnings.

15.4 WOMEN'S AND MEN'S OWNERSHIP OF ASSETS

15.4.1 Ownership of a House or Land and Documentation of Ownership

Ownership of a house or land

Respondents who own a house or land, whether alone or jointly with their spouse, someone else, or both their spouse and someone else.

Documentation of ownership of a house or land

Respondents whose name is on the title/deed or other government-recognized document.

Sample: Women and men age 15–49

Ownership and control of assets such as land and housing provide multiple benefits to individuals and households, including a secure place to live, livelihoods, protection during emergencies, and collateral. The 2021–22 CDHS collected information on women's and men's ownership of assets, including whether the assets are owned alone or jointly with someone else. Overall, house and land ownership is higher among women than men: 49% of women and 41% of men own a house, and 38% of women and 33% of men own land (**Tables 15.3.1** and **15.3.2** and **Figure 15.3**). Similarly, women are more likely than men to own a house alone (8% versus 3%) or land alone (7% versus 3%).

Documentation of ownership of assets is important for security of tenure and to leverage or liquidate assets. Twenty-one percent of women and 29% of men age 15–49 who own a house do not possess a title/deed for the house, and 18% of women and 28% of men who own land do not possess a title/deed for the land (**Tables 15.4.1**, **15.4.2**, **15.5.1**, and **15.5.2**). Notably, however, among both women and men who own a house or land and have a title/deed, the majority have their names on the document of ownership.

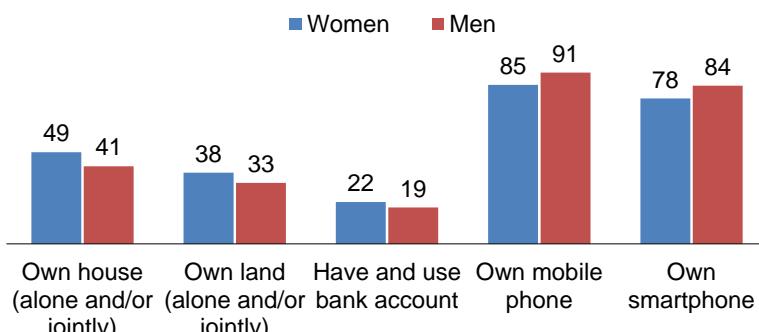

Trends: House and land ownership has declined over time among both women and men. The percentages of women who do not own a house or land increased from 39% and 46%, respectively, in 2014 to 51% and 62% in 2021–22. Similarly, the percentage of men who do not own a house increased from 49% to 59%, while the percentage who do not own land increased from 49% to 68%.

Patterns by background characteristics

- Among both women and men, home and land ownership increases sharply with age.
- The percentage of women and men who own a house or land is higher in rural areas than in urban areas. However, women and men in rural areas who own either asset are less likely to have a title/deed for the property they own than their urban counterparts.

Figure 15.3 Ownership of assets

Percentage of women and men age 15–49 who own a house, land, a mobile phone, a smartphone, and who have and use a bank account:

- House and land ownership varies greatly across provinces among both women and men. For example, the percentage of women who do not own land ranges from 39% in Ratanak Kiri to 91% in Phnom Penh, and the percentage among men ranges from 31% in Svay Rieng to 91% in Phnom Penh.
- The percentages of women and men who do not own land are lower among those with no formal education (49% and 50%, respectively) than among those with more than a secondary education (79% each).
- In general, house and land ownership among both women and men decreases with increasing education and household wealth. However, among women and men who own a house or land, the likelihood that their name is on the title/deed generally increases with increasing education and household wealth.

15.4.2 Ownership and Use of Mobile Phones and Bank Accounts

Use of bank accounts or mobile money services

Respondents who have and use a bank account or who used a mobile phone for financial transactions in the 12 months before the survey.

Sample: Women and men age 15–49

Twenty-two percent of women age 15–49 have and use a bank account for financial transactions, and 20% deposited or withdrew money from their own account in the last 12 months. These percentages are lower among men: 19% have and use a bank account for financial transactions and 18% have deposited or withdrawn money from their account in the last 12 months (**Tables 15.6.1** and **15.6.2**).

Eighty-five percent of women own a mobile phone, including 78% who own a smartphone. Only 22% of women have used a mobile phone for financial transactions in the last 12 months. Among men, 91% own a mobile phone, including 84% who own a smartphone, and 23% have used a mobile phone for financial transactions in the last 12 months (**Figure 15.3**).

Overall, less than one-third of women (29%) and men (27%) have and use a bank account or used a mobile phone for financial transactions in the 12 months before the survey.

Patterns by background characteristics

- Bank account ownership and use is higher among women and men in urban areas than in rural areas, as is ownership of mobile phones and smartphones and use of mobile phones for financial transactions.
- The percentages of women and men who have and use a bank account for financial transactions, who own a mobile phone or smartphone, and who have used a mobile phone for financial transactions the last 12 months increase sharply with increasing education and household wealth.
- The percentage of respondents who have and use a bank account or used a mobile phone for financial transactions in the 12 months before the survey increases with increasing education, from 11% among women with no education to 84% among those with more than a secondary education and from 8% among men with no education to 81% among those with more than a secondary education.

15.5 PARTICIPATION IN DECISION MAKING

Participation in major household decisions

Women are considered to participate in household decisions if they make decisions alone or jointly with their husband in all three of the following areas: (1) their own health care, (2) major household purchases, and (3) visits to their family or relatives.

Sample: Currently married women age 15–49

Men are considered to participate in household decisions if they make decisions alone or jointly with their wife in both of the following areas: (1) their own health care and (2) major household purchases.

Sample: Currently married men age 15–49

A much higher percentage of currently married women age 15–49 make decisions mainly alone about their own health care (44%) than decisions regarding major household purchases (16%) and visits to their family or relatives (21%), although more than 9 of 10 women participate alone or jointly with their husbands in each of the three separate decisions (**Table 15.7**, **Table 15.8.1**, and **Figure 15.4**). Overall, 88% of women participate in all three specified decisions either alone or jointly with their husbands; only 5% do not participate in any of the three decisions (**Table 15.8.1** and **Figure 15.4**).

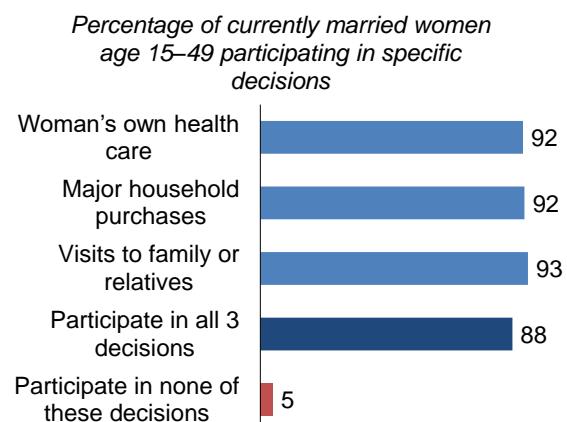

Among currently married men age 15–49, 75% participate alone or jointly with their wives in decisions regarding their own health care and 80% participate in decisions regarding major household purchases. Only 69% participate in both decisions (**Table 15.8.2**).

Trends: The percentage of currently married women who participate in all three specified decisions alone or jointly with their husbands has increased only slightly over time, from 86% in 2014 to 88% in 2021–22.

Patterns by background characteristics

- Women who are employed but do not earn cash are less likely to participate in all three specified decisions (74%) than women who are not employed (90%) and those who are employed for cash (89%) (**Table 15.8.1**).
- By province, the percentage of women who participate in all three specified decisions is highest in Tboung Khmum (99%) and lowest in Kampong Thom (62%).

Figure 15.4 Women's participation in decision making

15.6 ATTITUDES TOWARD WIFE BEATING

Attitudes toward wife beating

Respondents are asked if they agree that a husband is justified in hitting or beating his wife under each of the following five circumstances: she burns the food, she argues with him, she goes out without telling him, she neglects the children, and she refuses to have sex with him. If respondents answer “yes” in at least one circumstance, they are considered to have attitudes justifying wife beating.

Sample: Women and men age 15–49

Women’s and men’s acceptance of husbands beating their wives for any reason is an indication of lower status of women, and widespread socialization of such gender roles disempowers women. In Cambodia, a greater percentage of women (37%) than men (16%) age 15–49 agree that a husband is justified in hitting or beating his wife for at least one of the specified reasons (Table 15.9.1, Table 15.9.2, and Figure 15.5). Only 3% of women agree with all five specified reasons as justifications for a husband beating his wife.

Of the specified justifications, women are most likely to agree that a husband is justified in hitting or beating his wife if she neglects the children (31%), goes out without telling him (20%), or argues with him (16%) (Figure 15.5).

Trends: The percentage of respondents who agree that a husband is justified in hitting or beating his wife for at least one of the specified reasons declined between 2014 and 2021–22, from 50% to 37% among women and from 26% to 16% among men.

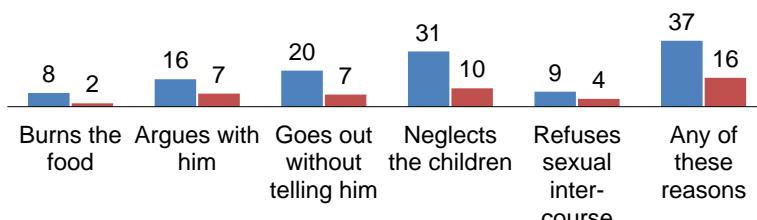

Patterns by background characteristics

- The percentage of women who agree with at least one specified reason for wife beating increases with the number of living children, from 31% among those without any living children to 53% among those with five or more living children.
- Women in rural areas are more likely than those in urban areas (45% versus 27%) to justify wife beating.
- By province, the percentage of women who agree that a husband is justified in hitting or beating his wife for at least one specified reason is highest in Battambang (63%) and lowest in Kampong Speu and Koh Kong (7% each).
- The percentage of women who justify wife beating decreases sharply with increasing education and household wealth. For example, 50% of women with no education justify wife beating, as compared with 15% of women with more than a secondary education.

Figure 15.5 Attitudes towards wife beating

Percentage of women and men age 15–49 who agree that a husband is justified in beating his wife for specific reasons

■ Women ■ Men

15.7 NEGOTIATING SEXUAL RELATIONS

To assess attitudes toward wives negotiating safer sexual relations with their husbands, women and men age 15–49 were asked whether they thought that a wife is justified in refusing to have sexual intercourse with her husband if she knows he has sex with other women and asking that he use a condom if she knows he has a sexually transmitted infection (STI).

Women are less likely than men to believe that a woman is justified in refusing to have sexual intercourse with her husband if she knows he has sex with other women (75% versus 82%). Similarly, a lower percentage of women (81%) than men (89%) believe that women are justified in asking their husband to use a condom when they know that he has an STI (**Table 15.10**).

To assess the ability of women to actually negotiate safer sexual relations with their husband, currently married women age 15–49 were asked whether they could say no to their husband if they do not want to have sexual intercourse and whether they could ask their husband to use a condom.

Ninety-one percent of women reported that they can say no to their husband if they do not want to have sexual intercourse, while a lower percentage (81%) said that they can ask their husband to use a condom (**Table 15.11**). Notably, women are less likely to report that they can ask their husband to use a condom than to say no to sexual intercourse in almost all cases.

15.8 WOMEN'S PARTICIPATION IN DECISION MAKING REGARDING SEXUAL AND REPRODUCTIVE HEALTH

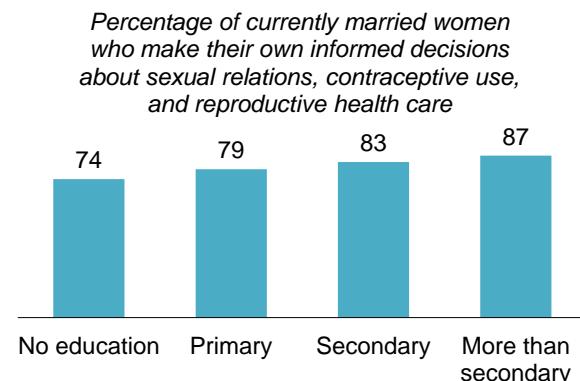

Informed decision making on sexual relations, contraceptive use, and reproductive health

Women are considered to make their own informed decisions on sexual relations, contraceptive use, and reproductive health if (1) they can say no to their husband if they do not want to have sexual intercourse, (2) they make decisions about the use of family planning alone or jointly with their husband, and (3) they make decisions about their own health care alone or jointly with their husband.

Sample: Currently married women age 15–49

Table 15.12 presents information on the percentage of women who can say no to their husband if they do not want to have sexual intercourse (**Table 15.11**), the percentage who participate alone or jointly with their husband in making decisions about the use of family planning (**Table 7.17**), and the percentage who participate alone or jointly with their husband in making decisions about their own health care (**Table 15.8.1**). Overall, 80% of women reported making their own informed decisions on sexual relations, contraceptive use, and reproductive health. This percentage varies slightly by background characteristics. Notably, however, it increases consistently with increasing education, from 74% among women with no education to 87% among women with more than a secondary education (**Figure 15.6**).

Figure 15.6 Informed decision making regarding sexual and reproductive health by education

LIST OF TABLES

For more information on women's empowerment, see the following tables:

¹ Percentages of currently married women who make decisions regarding sexual relations, contraceptive use, and health care are presented in Table 15.11, Table 7.17, and Table 15.8.1, respectively.

Key Findings

- **Drinking water:** 89% of the household population has access to at least basic drinking water service during the dry season, and 92% has access during the rainy season. Two percent of the population has limited drinking water service during the dry season and 1% during the rainy season.
- **Availability of drinking water:** 89% of the population has sufficient quantities of drinking water when needed, and proportions are high in both urban and rural areas.
- **Treatment of drinking water:** 68% of the population lives in households that use an appropriate water treatment method. Appropriate treatment is slightly more common among those in urban areas (70%) than rural areas (66%).
- **Sanitation:** 80% of the household population has access to at least basic sanitation service. There is a marked difference in access between urban (90%) and rural populations (74%).
- **Management of excreta:** 85% of the household population uses facilities that are connected to a sewer, with excreta safely disposed of on-site, or with excreta removed for treatment off-site.

The extent to which households have access and use of safe drinking water and sanitation facilities and engage in hygienic practices has profound implications for the health, safety, and overall well-being of the population. This chapter presents information on source of drinking water, type of sanitation facility, disposal of excreta (including disposal of young children's stools), handwashing, and menstrual hygiene.

16.1 DRINKING WATER SOURCES, AVAILABILITY, AND TREATMENT

Improved sources of drinking water

Include piped water, public taps, standpipes, tube wells, boreholes, protected dug wells and springs, rainwater, water delivered via a tanker truck or a cart with a small tank, and bottled water.

Sample: Households and de jure population

Cambodia has experienced a dramatic increase in access to drinking water services in the last few decades. Despite this progress, 10% of households do not yet have access to an improved source of drinking water in the dry season (including 5% that use surface water). The percentage of households without access to an improved source of drinking water drops to 7% during the rainy season due to increased use of rainwater for drinking. The main sources of drinking water in the dry season are water piped into the household's dwelling/yard/plot (26%), bottled water (25%), tube wells or boreholes (21%), and rainwater (9%). In the rainy season, households rely mostly on water piped into the dwelling/yard/plot (25%), followed by bottled water (22%), tube wells or boreholes (20%), and rainwater (19%) (**Tables 16.1.1 and 16.1.2**).

In the dry season, 84% of households have water on their premises or have water delivered to their dwelling (93% in urban areas and 78% in rural area). In the rainy season, this percentage drops to 77% (88% in urban areas and 70% in rural area). In both seasons, only 1% of households that do not have water on the premises spend more than 30 minutes (round trip) to obtain drinking water (**Tables 16.1.1** and **16.1.2**).

Trends: From 2014 to 2021–22, the percentage of households using an improved source of drinking water increased from 65% to 91% during the dry season and from 84% to 93% during the rainy season.

16.1.1 Drinking Water Service Ladder

Drinking water service ladder

Safely managed

Drinking water from an improved water source that is located on the premises, available when needed, and free from fecal and priority chemical contamination.

Basic

Drinking water from an improved source, provided either water is on the premises or round-trip collection time is 30 minutes or less.

Limited

Drinking water from an improved source, and round-trip collection time is more than 30 minutes.

Unimproved

Drinking water from an unprotected dug well or unprotected spring.

Surface water

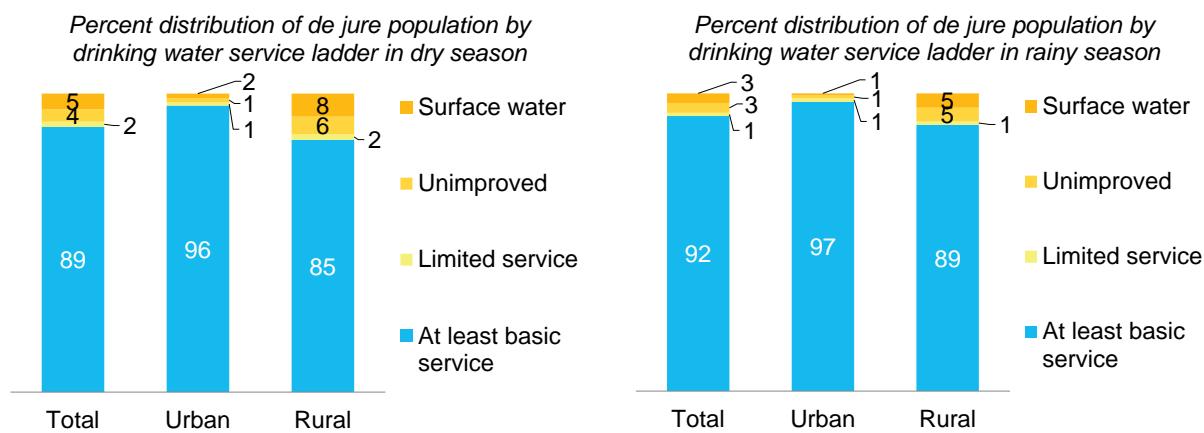

Drinking water directly from a river, dam, lake, pond, stream, canal, or irrigation canal.

Sample: De jure population

Building off the classification of drinking water sources as improved or unimproved, the Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (JMP) has devised a five-rung drinking water service ladder to benchmark and compare progress towards achieving the United Nation's Sustainable Development Goals (WHO/UNICEF 2018). The CDHS captured information on four of the five rungs. Because the survey did not include testing drinking water for fecal or chemical contamination, safely managed and basic drinking water services cannot be distinguished and are grouped together in **Tables 16.2.1** and **16.2.2** as “at least basic service.”

Eighty-nine percent of the Cambodian population has access to at least basic drinking water service during the dry season, and 92% has access during the rainy season. Two percent of the population has limited drinking water service during the dry season and 1% during the rainy season (**Figure 16.1**).

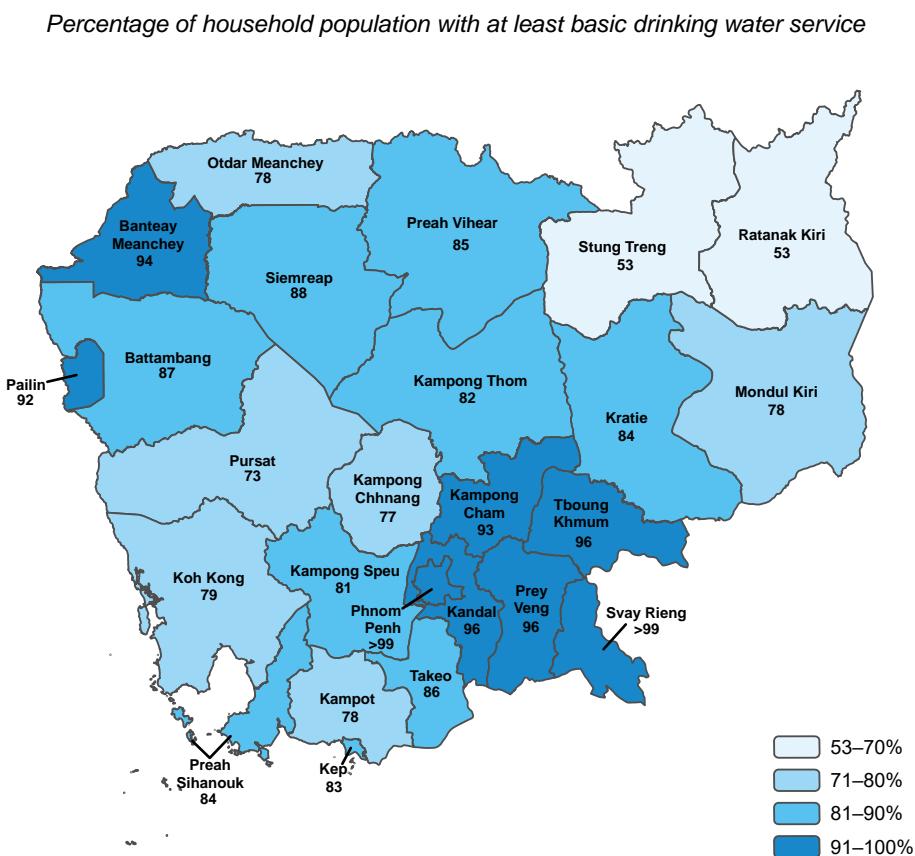

Figure 16.1 Household population drinking water service by residence

Patterns by background characteristics

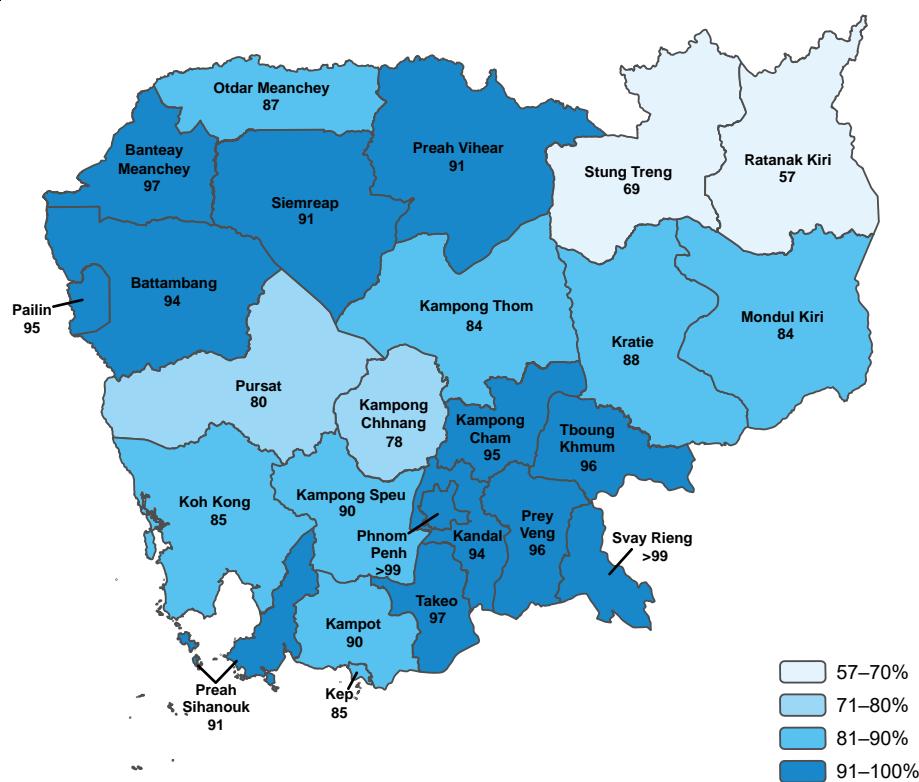

- Access to at least basic drinking water service is substantially higher among the urban population than the rural population (96% versus 85% during the dry season and 97% versus 89% during the rainy season).
- The percentage of the population with access to at least basic drinking water service varies across the 25 provinces (**Maps 16.1.1** and **16.1.2**); the percentage is lowest in Ratanak Kiri and Stung Treng (53% each in the dry season and 57% and 69%, respectively, in the rainy season) and highest in Syay Rieng (100% in both the dry and rainy seasons) (**Tables 16.2.1** and **16.2.2**).

Map 16.1.1 At least basic drinking water service by province, dry season

Map 16.1.2 At least basic drinking water service by province, rainy season

Percentage of household population with at least basic drinking water service

- The percentage of the population with access to at least basic drinking water service increases with increasing household wealth in both the dry and rainy seasons.

16.1.2 Person Collecting Drinking Water

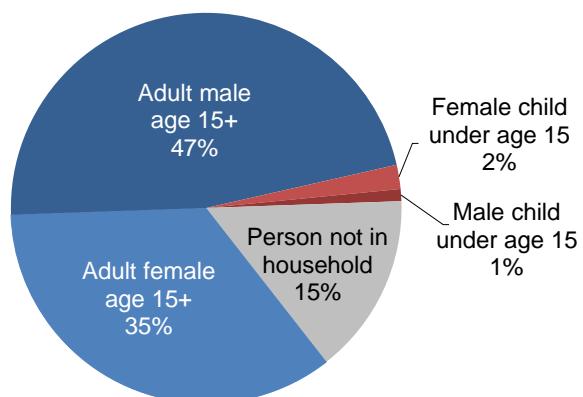

In Cambodia, 16% of the population lives in households that do not have water on their premises during the dry season. The person who most commonly collects water is an adult male age 15 or older (47%), followed by an adult female age 15 or older (35%) and a person not in the household (15%) (**Table 16.3** and **Figure 16.2**).

Patterns by background characteristics

- Rural residents are more likely than urban residents to not have drinking water on the premises (21% versus 7%).
- By province, the percentage of the population without water on the premises ranges from less than 1% in Phnom Penh to 60% in Stung Treng.

Figure 16.2 Person collecting drinking water

Among the de jure household population without drinking water on premises, percent distribution by the person who collects drinking water

- The percentage of household residents without drinking water on the premises declines dramatically with increasing household wealth, from 38% among those in the lowest wealth quintile to 2% among those in the highest wealth quintile.

16.1.3 Availability of Drinking Water

Availability of sufficient drinking water

Percentage of the population with sufficient quantities of drinking water in the last month.

Sample: De jure population

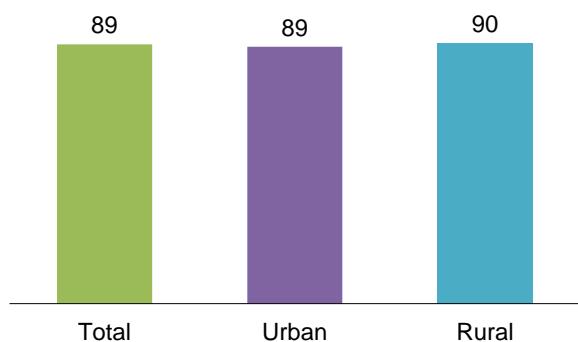

Eighty-nine percent of the population reported having sufficient quantities of drinking water in the month prior to the survey (**Table 16.4**). This proportion varies little by residence or household wealth (**Figure 16.3**). By province, the percentage of the population with sufficient quantities of water varies from a low of 65% in Pursat to a high of 97% in Kampong Chhnang.

16.1.4 Treatment of Drinking Water

Clean water is a basic human need. Only about two-thirds of households (68%) reported using an appropriate method to treat their water prior to drinking. Treatment is slightly less common in rural areas (66%) than urban areas (70%). Boiling water and using a ceramic, sand, or other filter are the most common types of water treatment (55% and 20%, respectively) (**Table 16.5**).

Figure 16.3 Availability of sufficient quantities of drinking water by residence

Percentage of household population with sufficient quantities of drinking water in the last month

16.2 SANITATION

Improved sanitation facility

Includes flush/pour flush toilets that flush water and waste to a piped sewer system, septic tank, pit latrine, or unknown destination; ventilated improved pit (VIP) latrines; pit latrines with slabs; and composting toilets.

Sample: Households and de jure population

Eighty-eight percent of households use improved toilet facilities, including 96% in urban areas and 84% in rural areas (**Table 16.6**). However, 10% of households continue to practice open defecation (15% in rural areas and 3% in urban areas). Flush/pour flush toilets that flush water and waste to a septic tank are the most common type of sanitation facility in Cambodia (69%). Seventeen percent of households use flush/pour flush toilets that flush water and waste to a piped sewer system (39% of urban households and 3% of rural households).

Trends: Access to improved toilet facilities has increased markedly over time, from 55% in 2014 to 88% in 2021–22.

16.2.1 Sanitation Service Ladder

Sanitation service ladder

Safely managed

Use of improved facilities that are not shared with other households and where excreta are safely disposed of in situ or transported and treated off-site.

Basic

Use of improved facilities that are not shared with other households.

Limited

Use of improved facilities shared by two or more households.

Unimproved

Use of pit latrines without a slab or platform, hanging latrines, or bucket latrines.

Open defecation

Disposal of human feces in fields, forests, bushes, open bodies of water, beaches, or other open spaces or with solid waste.

Sample: De jure population

The JMP has devised a five-rung sanitation service ladder to benchmark and compare progress towards achieving SDG targets related to sanitation. The CDHS captured information about all five rungs. However, for those households whose excreta were taken off-site, it is not possible to know if they were treated appropriately, and therefore safely managed and basic sanitation services are grouped together in **Table 16.7** as “at least basic service.”

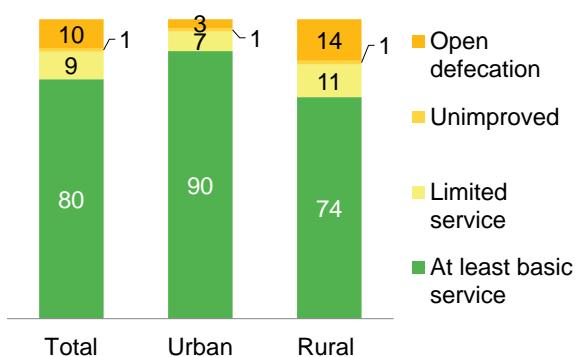

The 2021–22 CDHS results show that 8 of 10 persons in the household population have at least basic sanitation service.

Patterns by background characteristics

- Access to at least basic sanitation service is higher in the urban population (90%) than in the rural population (74%) (**Figure 16.4**).
- Access to at least basic sanitation service varies widely across provinces, from a low of 42% in Ratanak Kiri to a high of 95% in Phnom Penh.
- The percentage of the household population with at least basic sanitation service increases with increasing household wealth, from 42% in the lowest wealth quintile to 99% in the highest quintile.
- Open defecation is still common in Ratanak Kiri (48%), Stung Treng (42%), and Mondul Kiri (38%).

Figure 16.4 Household population sanitation service by residence

Percent distribution of de jure population by sanitation service ladder

16.2.2 Removal and Disposal of Excreta

Disposal of excreta from on-site facilities

Excreta safely disposed of in situ

Includes septic tanks and latrines in which waste is buried in a covered pit, waste is never emptied, and it is unknown if waste is ever emptied.

Excreta disposed of unsafely

Includes septic tanks and latrines in which waste is emptied to uncovered pits, open ground, water bodies, or other locations.

Excreta removed for treatment

Includes septic tanks and latrines in which waste is removed by a service provider to a treatment plant or an unknown location or is removed by a non-service provider to an unknown location.

Sample: De jure population with on-site sanitation facilities (septic tanks, pit latrines, and composting toilets)

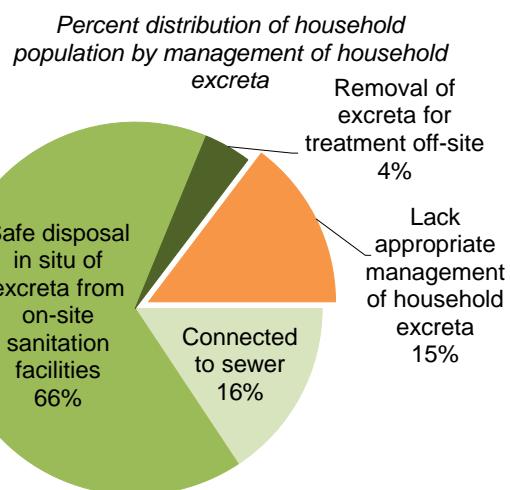

Information on the removal and disposal of excreta from on-site sanitation facilities is essential for assessing the proportion of the population using safely managed sanitation services.

Among the household population using improved on-site sanitation facilities, 1% have had their waste removed by a service provider to a treatment plant, 9% have the waste removed by a service provider but do not know the removal location, and 86% have never emptied their septic tank or latrine.

Overall, for 88% of the population with on-site sanitation facilities, excreta was safely disposed of in situ, for 3%, excreta was disposed of unsafely, and for 10%, excreta was removed for treatment (**Table 16.8**).

Table 16.9 shows the percent distribution of the de jure population by management of excreta from household sanitation facilities. Among household residents, 16% have facilities connected to a sewer, 66% safely dispose of excreta from on-site sanitation facilities in situ, and 4% have excreta removed for treatment off-site (**Figure 16.5**). Overall, 85% of the household population has access to facilities that are connected to a sewer, has excreta safely disposed of on-site, or has excreta removed for treatment off-site. Fifteen percent lack appropriate management of household excreta including 10% that engage in open defecation and 5%.

Figure 16.5 Appropriate management of household excreta

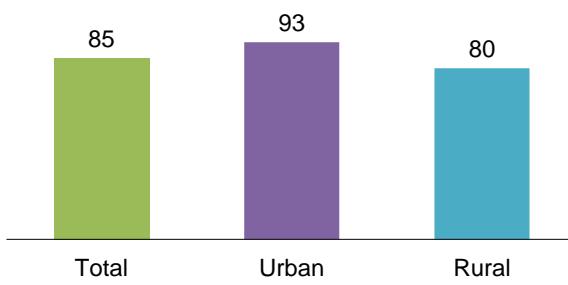

Note: Figures do not add up to 100% due to rounding.

Patterns by background characteristics

- Appropriate management of excreta (household is connected to a sewer, has excreta safely disposed of on-site, or has excreta removed for treatment off-site) is lower among the rural population (80%) than the urban population (93%) (**Figure 16.6**).
- The percentage of the population that safely manages excreta from household sanitation facilities varies widely across provinces, from a low of 52% in Ratanak Kiri to a high of 96% in Phnom Penh.
- The percentage of the population that safely manages excreta from household sanitation facilities increases with increasing household wealth, rising from 56% in the lowest wealth quintile to 96% in the highest.

Figure 16.6 Appropriate management of household excreta by residence

Percentage of household population connected to sewer or using improved on-site sanitation facilities with safe disposal of excreta on site or removal of excreta for off-site treatment

16.3 DISPOSAL OF CHILDREN'S STOOLS

Appropriate disposal of children's stools

The child's last stools were put or rinsed into a toilet or latrine, or the child used a toilet or latrine.

Sample: Youngest children under age 2 living with their mother

Appropriate disposal of children's stools is important to prevent the spread of disease. Only 30% of youngest children under age 2 living with their mother had their last stools disposed of appropriately (**Table 16.10**).

Patterns by background characteristics

- Children's stools are somewhat more likely to be disposed of appropriately in urban households (36%) than in rural households (27%).
- The percentage of children whose stools are disposed of appropriately generally increases with increasing mother's education; 26% of children of mothers with no education have their stools disposed of appropriately, as compared with 37% of children of mothers with more than a secondary education.
- The percentage of children whose stools are disposed of appropriately ranges from 4% in Preah Sihanouk to 57% in Banteay Meanchey.
- Forty-one percent of children from households in the highest wealth quintile have their stools disposed appropriately, compared with only 16% of children from households in the lowest wealth quintile.

16.4 HANDWASHING

Handwashing facilities

Basic

Availability of a handwashing facility on the premises with soap and water.

Limited

Availability of a handwashing facility on the premises without soap and water.

Sample: De jure population for whom a place for handwashing was observed or with no place for handwashing in dwelling, yard, or plot; excludes the de jure population for whom permission to see the facility was not granted

Handwashing is an important step in monitoring hygiene and preventing the spread of disease. Rather than asking direct questions on the practice of handwashing, which can be subject to overreporting, interviewers asked to see the place where members of the household most often washed their hands. A place for washing hands was observed for 88% of the de jure population (78% in a fixed location and 10% mobile) (**Table 16.11**). At the time of observation, 99% of households had water available at the handwashing place and 94% had soap or a cleansing agent (**Table 16.11**).

According to the definitions of handwashing facilities developed by the JMP, 84% of the population has a basic handwashing facility and 6% has a limited handwashing facility.

16.5 MENSTRUAL HYGIENE

Appropriate menstrual hygiene materials

Reusable sanitary pads, disposable sanitary pads, tampons, menstrual cup, cloth, toilet paper, and/or cotton wool.

Sample: Women age 15–49 with a menstrual period in the last year

Privacy and use of appropriate menstrual hygiene materials

Percentage of women who were able to wash and change in privacy and who used appropriate materials during their last menstruation.

Sample: Women age 15–49 with a menstrual period in the last year who were home during their last menstrual period

Among women age 15–49 whose most recent menstrual period was in the last year, 66% used disposable sanitary pads, 32% used reusable sanitary pads, 3% used underwear only, 1% used nothing, and 1% used cloth to absorb blood from their most recent menstrual period for hygienic protection (**Table 16.12**).

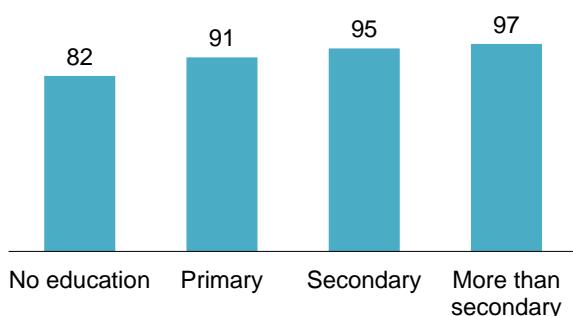

Among women whose most recent menstrual period was in the last year and who were at home during their last menstrual period, 92% used appropriate materials and were able to wash and change in privacy.

Patterns by background characteristics

- The percentage of women who used appropriate materials to absorb blood during their most recent menstrual period and were able to wash and change in privacy is higher in urban areas (95%) than in rural areas (90%).
- Use of appropriate materials during the last menstrual period and the ability to wash and change in privacy increase with increasing education, from 82% among women with no formal education to 97% among those with more than a secondary education (**Figure 16.7**).
- There is a positive association between using appropriate menstrual hygiene materials and being able to wash and change in privacy and household wealth (**Table 16.12**).

Figure 16.7 Menstrual hygiene by education

Percentage of women who were able to wash and change in privacy and who used appropriate materials during last menstruation

Note: Service ladder concept/definitions are based on the WHO/UNICEF Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (JMP).

¹ Defined as use of improved facilities that are not shared with other households. Includes safely managed sanitation service, which is not shown separately.

² Defined as use of improved facilities shared by two or more households

³ Use of flush/pour flush toilet not to sewer, septic tank, or pit latrine; pit latrine without a slab/open pit; hanging toilets/latrine; or bucket

Table 16.8 Emptying and removal of waste from on-site sanitation facilities

Percent distribution of de jure population in households with septic tanks and improved latrines by method of emptying and removal, and percentage of on-site sanitation facilities for which excreta was safely disposed of in situ, percentage of on-site sanitation facilities for which excreta was disposed of unsafely, and percentage of on-site sanitation facilities for which excreta was removed for treatment, according to background characteristics, Cambodia DHS 2021–22

Background characteristic	Percent distribution of method of emptying and disposal of waste from septic tanks or other on-site sanitation facilities								Percentage of population with on-site sanitation facilities for which:			Number of persons with improved on-site sanitation facilities	
	Removed by a service provider to treatment plant	Removed by a service provider, don't know where	Buried in a covered pit	Emptied to uncovered pit, open ground, water body, or elsewhere	Other	Don't know where waste was taken	Never emptied	Don't know if ever emptied	Total	Excreta was safely disposed of in situ ¹	Excreta was disposed of unsafely ²	Excreta was removed for treatment ³

Note: On-site sanitation facilities are those where excreta are stored in a septic tank, pit latrine, or composting toilet.

¹ Includes septic tanks and latrines in which waste was buried in a covered pit, never emptied, and don't know if ever emptied

² Includes septic tanks and latrines in which waste was emptied to uncovered pits, open ground, water body, or other locations

³ Includes septic tanks and latrines in which waste was removed by a service provider to a treatment plant or an unknown location or was removed by a non-service provider to an unknown location

Table 16.9 Management of household excreta

Percent distribution of de jure population by management of excreta from household sanitation facilities, according to background characteristics, Cambodia DHS 2021–22

Background characteristic	Connected to sewer	Using improved on-site sanitation facilities						Percentage connected to sewer, with safe disposal on-site, or with removal for treatment off-site	Number of persons
		Safe disposal in situ of excreta from on-site sanitation facilities	Unsafe disposal of excreta from on-site sanitation facilities	Removal of excreta for treatment off-site	Using improved sanitation facilities, on-site status unknown	Using unimproved sanitation facilities	Practicing open defecation

¹ Reusable sanitary pads, disposable sanitary pads, tampons, menstrual cup, cloth, toilet paper, and/or cotton wool

Key Findings

- **Disability by domain:** 21% of household members age 5 or above have some level of difficulty in at least one functional domain, and 4% have a lot of difficulty or cannot function at all in at least one domain.
- **Disability by age:** The proportion of household members who have some difficulty in at least one domain generally rises with increasing age. For instance, less than 2% of household members in the age groups below 40 years have a lot of difficulty or cannot function at all in at least one domain, as compared with 20% of those age 60 and above.
- **Disability by marital status:** 20% each of women and men who are widowed have a lot of difficulty or cannot function at all in at least one domain compared to 6% or less among women and 10% or less among men in other marital status categories.
- **Disability by residence:** 7% of rural women and 6% of rural men have a lot of difficulty or cannot function at all in at least one domain compared to 4% of urban women and 3% of urban men.
- **Disability by education and household wealth:** The percentages of men and women who have some difficulty or have a lot of difficulty or cannot function at all in at least one domain generally decline with increasing education and household wealth.

The 2021–22 CDHS included The DHS Program’s disability module, a series of questions based on the Washington Group on Disability Statistics (WG) questions, which in turn are based on the framework of the World Health Organization’s International Classification of Functioning, Disability, and Health. The questions address six core functional domains—seeing, hearing, communication, cognition, walking, and self-care—and provide basic necessary information on disability comparable to that being collected worldwide via the WG disability tools.

In Cambodia, the percentage of the population living with disabilities is one of the highest in the world. In 2009, the government of Cambodia promulgated the Law on the Protection and the Promotion of the Rights of People with Disabilities, which provides for the right of people with disabilities to be employed without discrimination in the public and private sectors. It requires companies employing more than a certain number of full-time workers to employ full-time a proportional number of disabled people. It further requires that reasonable accommodations be made at the workplace.

17.1 DISABILITY BY DOMAIN AND AGE

The respondent to the Household Questionnaire provided information for all household members and visitors on whether they had no difficulty, some difficulty, a lot of difficulty, or no ability at all in the

specified domain. The results, based on 74,341 people, are presented in **Table 17.1** for the de facto household population age 5 and older.

Functional domains

Seeing, hearing, communicating, remembering or concentrating, walking or climbing steps, and washing all over or dressing.

Sample: De facto household population age 5 and above

Overall, 21% of de facto household members age 5 and older have some level of difficulty in at least one domain. Four percent either have a lot of difficulty or cannot function at all in at least one domain. Difficulty seeing was more commonly reported than other difficulties.

The percentage of people who have some level of difficulty in at least one domain rises sharply after age 50. Forty-seven percent of people age 50–59 and 57% of those age 60 or older have some level of difficulty in at least one domain. The percentage of people who have a lot of difficulty or cannot function at all in at least one domain increases steadily with increasing age.

17.2 DISABILITY AMONG ADULTS BY OTHER BACKGROUND CHARACTERISTICS

Functional domains

Seeing, hearing, communicating, remembering or concentrating, walking or climbing steps, and washing all over or dressing.

Sample: De facto household population age 15 or above

Tables 17.2.1 and **17.2.2** present disability data for de facto household members age 15 and older by background characteristics. Sixty-six percent of women and 72% of men have no difficulty in any domain. Twenty-four percent of women and 19% of men have difficulty seeing, the most prominent type of difficulty in the population. The next most common difficulty reported is difficulty remembering or concentrating (20% of women and 14% of men). Overall, 28% of women and 23% of men have some difficulty in at least one domain.

Patterns by background characteristics

- The data show that widowed women and widowed men are more likely to have difficulty in any domain than other women and men. Fifty percent of widowed women and 43% of widowed men have some difficulty in at least one domain, whereas 20% each of widowed women and widowed men have a lot of difficulty or cannot function at all in at least one domain (**Tables 17.2.1** and **17.2.2**).
- By province, the percentages of women and men who have some difficulty in at least one domain are highest in Banteay Meanchey (47% and 41%, respectively) and lowest in Kampong Speu (5% and 6%, respectively).
- The percentage of women who have some difficulty in at least one domain decreases with increasing education, from 43% among those with no education to 12% among those with more than a secondary education.
- A smaller percentage of women in the highest wealth quintile have some difficulty in at least one domain (22%) compared to women in the lowest wealth quintile (34%) (**Table 17.2.1**).
- Similar to the case with women, the percentage of men who have some difficulty in at least one domain generally decreases with increasing education and wealth (**Table 17.2.2**).

- The proportions of women and men who have a lot of difficulty or cannot function at all are 6% and 5%, respectively. It is noteworthy that these proportions have an inverse relationship with education and household wealth (**Tables 17.2.1** and **17.2.2**).

LIST OF TABLES

For more information on disability, see the following tables:

- **Table 17.1 Disability by domain and age**
- **Table 17.2.1 Disability among adults according to background characteristics: Women**
- **Table 17.2.2 Disability among adults according to background characteristics: Men**

Table 17.1 Disability by domain and age

Percent distribution of the de facto household population age 5 and over by degree of difficulty in functioning according to domain, and percent distribution by highest degree of difficulty in functioning in at least one domain by age, Cambodia DHS 2021–22

Domain and age	Degree of difficulty					A lot of difficulty or cannot do at all	Number of persons
	No difficulty	Some difficulty	A lot of difficulty	Cannot do at all	Don't know		
Domain							
Difficulty seeing	83.3	15.0	1.5	0.1	0.0	100.0	1.7 74,341
Difficulty hearing	93.1	5.9	0.9	0.1	0.0	100.0	1.0 74,341
Difficulty communicating	96.1	3.0	0.6	0.2	0.0	100.0	0.8 74,341
Difficulty remembering or concentrating	86.6	11.9	1.3	0.2	0.0	100.0	1.4 74,341
Difficulty walking or climbing steps	90.1	8.1	1.5	0.3	0.0	100.0	1.8 74,341
Difficulty washing all over or dressing	96.4	3.0	0.5	0.2	0.0	100.0	0.7 74,341
Difficulty in at least one domain^{1,2}							
5–9	92.7	6.5	0.4	0.3	0.1	100.0	0.8 8,864
10–14	95.8	3.2	0.6	0.4	0.0	100.0	1.0 9,107
15–19	94.5	4.2	0.8	0.5	0.0	100.0	1.3 6,369
20–29	90.9	7.6	0.9	0.6	0.1	100.0	1.4 11,227

Key Findings

- **Adult mortality:** The adult mortality rate is 1.30 deaths per 1,000 population among women and 2.81 deaths per 1,000 population among men.
- **Lifetime risk of maternal death:** The lifetime risk of maternal death indicates that 1 in 250 women in Cambodia will die from maternal causes.
- **Maternal mortality ratio:** The maternal mortality ratio for the 7-year period before the 2021–22 CDHS is estimated at 154 maternal deaths per 100,000 live births.
- **Pregnancy-related mortality ratio:** The estimated pregnancy-related mortality ratio for the 7-year period preceding the 2021–22 CDHS is 163 deaths per 100,000 live births.

Adult and maternal mortality indicators can be used to assess the health status of a population. In most developing countries, reproductive health is a major concern, and there is a need for reliable data on maternal deaths.

WHO explains the problem of maternal mortality using a delay model that includes delays in seeking health care, delays in reaching health facilities, and poor health services in facilities. This model has been associated with human, health system, and socioeconomic factors such as poverty, poor emergency obstetric services, and fatalistic beliefs. These problems have contributed to a high incidence of infectious diseases, postpartum hemorrhage, hypertensive disorders, unsafe abortions, and prolonged labor, which have led to high adult and maternal mortality. The United Nations' Sustainable Goals (SDG) target, SDG 3.1, is to reduce the global maternal mortality ratio to less than 70 per 100,000 live births by 2030.

Estimation of mortality rates requires complete and accurate data on adult and maternal deaths. In the 2021–22 CDHS, data were collected from all female respondents on the survival of their sisters and brothers to obtain an estimate of adult mortality. Questions were included to determine if any of the sisters' deaths were maternity related, which permits an estimation of maternal mortality—a key indicator of maternal health and well-being.

This chapter presents information on the levels of and trends in adult and maternal mortality in Cambodia. The chapter includes a summary measure ($_{35}q_{15}$) that represents the probability of dying between exact ages 15 and 50—that is, between the 15th and 50th birthdays.

18.1 DATA

The 2021–22 CDHS collected information on sibling history by asking each female respondent to list all children born to her biological mother, starting with the first born. The respondent was then asked whether each of these siblings was still alive. For living siblings, the interviewer asked the current age of each sibling. For deceased siblings, age at death and number of years since death were recorded. When a respondent could not provide precise information on age at death or years since death, approximate but quantitative answers were accepted.

For sisters who died at age 12 or older, three questions were asked to determine whether the death was pregnancy related: “Was [NAME OF SISTER] pregnant when she died?” and, if the response was negative, “Did she die during childbirth?” and, if not, “Did she die within 2 months after the end of a pregnancy or childbirth?” For sisters who died within 2 months after the end of pregnancy or childbirth, the timing of her death was further refined by asking “How many days after the end of the pregnancy or childbirth did [NAME OF SISTER] die?” For every sister and brother who had died, the respondent was asked whether the sibling had died from an act of violence or an accident. Estimates of maternal mortality are based on those deaths that occurred during pregnancy, during childbirth, or within the 42 days after the end of pregnancy or childbirth and that did not occur by accident or violence; however, other incidental deaths, such as those caused by infectious or chronic disease, were not identified and were therefore not excluded from the estimates of maternal mortality.

A total of 76,527 siblings were recorded in the adult mortality section of the 2021–22 CDHS (data not shown). Current age (used to estimate exposure to death) was reported for all surviving siblings. Data on age at death and years since death were obtained for all dead siblings. Data capture via CAPI may have aided the completeness of data on siblings because in the CAPI system, interviewers are required to populate all relevant fields in order to progress through the interview. The sex ratio for enumerated siblings (the ratio of brothers to sisters multiplied by 100) is 105.6 (see **Table C.16** in Appendix C).

18.2 DIRECT ESTIMATES OF ADULT MORTALITY

Adult mortality rate

The number of adult deaths per 1,000 population age 15–49. Adult mortality rates by 5-year age groups are calculated as follows: the number of deaths to a respondent’s siblings in each age group is divided by the number of person-years of exposure to the risk of dying in that age group during the 7 years preceding the survey. The number of deaths is the number of siblings (brothers or sisters) reported as having died within the 7 years preceding the survey. The person-years of exposure in each age group are calculated for both surviving and dead siblings based on their current age (living siblings) or age at death and years since death (dead siblings).

Sample: Siblings (both living and dead) who were age 15–49 in the 7 years preceding the survey, by sex and 5-year age groups

Evaluating the plausibility and stability of overall adult mortality is one way to assess the quality of the data used to estimate maternal mortality. If estimated rates of overall adult mortality are implausible, rates based on a subset of deaths (maternal deaths in particular) may have serious problems.

The reported ages at death and years since death of the respondents’ brothers and sisters are used to make direct estimates of adult mortality. Because of differentials in exposure to the risk of dying, this report presents age- and sex-specific death rates.

To ensure a sufficiently large number of adult deaths to generate a robust estimate, the rates are calculated for the 7-year period before the survey (roughly late 2014 and early 2015 to late 2021 and early 2022). Nevertheless, age-specific mortality rates obtained in this manner are subject to considerable sampling variation. Use of this 7-year period is a compromise between the desire for the most recent data and the need to minimize the level of sampling error.

Table 18.1 and **Figure 18.1** show age-specific mortality rates among women and men age 15–49 for the 7 years before the 2021–22 CDHS. Mortality is lower among women (1.30 deaths per 1,000 population) than among men (2.81 deaths per 1,000 population). Among both women and men, mortality rates generally increase with increasing age. Mortality rates are higher for men than for women in all age groups (**Figure 18.1**).

18.3 TRENDS IN ADULT MORTALITY

Table 18.2 shows the probability of a woman or man age 15 dying by age 50 ($_{35}q_{15}$) if the person experienced the age-specific death rates shown in

Table 18.1 – that is, the death rates observed in the 7 years preceding the survey. According to the 2021–22 CDHS, 48 of every 1,000 women age 15 and 102 of every 1,000 men age 15 would be expected to die before age 50.

Table 18.2 also presents the $_{35}q_{15}$ from previous CDHS surveys. A comparison of the 2000 CDHS to the 2021–22 CDHS shows the probability of dying between ages 15 and 50 decreased by 62% among women (from 124 to 48 per 1,000) and by 37% among men (from 163 to 102 per 1,000).

18.4 DIRECT ESTIMATES OF MATERNAL MORTALITY

Maternal mortality rate

The number of maternal deaths per 1,000 women age 15–49. Maternal mortality rates by 5-year age groups are calculated by dividing the number of maternal deaths to female siblings of respondents in each age group by the total person-years of exposure of the sisters to the risk of dying in that age group during the 7 years preceding the survey. The number of deaths is the number of sisters reported as having died in the 7 years preceding the survey during either pregnancy or delivery, or in the 42 days following the delivery or termination of a pregnancy, by their age group at the time of death; deaths due to accidents or violence are excluded. The person-years of exposure in each age group are calculated for both surviving and dead sisters based on their reported current age (living sisters) or age at death and years since death (dead sisters).

Sample: Sisters (both living and dead) age 15–49 in the 7 years preceding the survey, by 5-year age groups

Maternal mortality ratio

The number of maternal deaths per 100,000 live births. The maternal mortality ratio is calculated by dividing the age-standardized maternal mortality rate for women age 15–49 in the 7 years preceding the survey by the general fertility rate (GFR) for the same time period.

Maternal deaths are a subset of all female deaths; they are defined as any deaths that occur during pregnancy or childbirth or within 42 days after the birth or termination of a pregnancy. Maternal deaths do not include deaths due to accidents or violence. Two methods are generally used to estimate maternal mortality in developing countries: the indirect sisterhood method (Graham et al. 1989) and a direct variant of the sisterhood method (Rutenberg and Sullivan 1991; Stanton et al. 1997). In the 2021–22 CDHS, the direct method of estimating maternal mortality was used.

Figure 18.1 Adult mortality rates by age

Deaths per 1,000 population

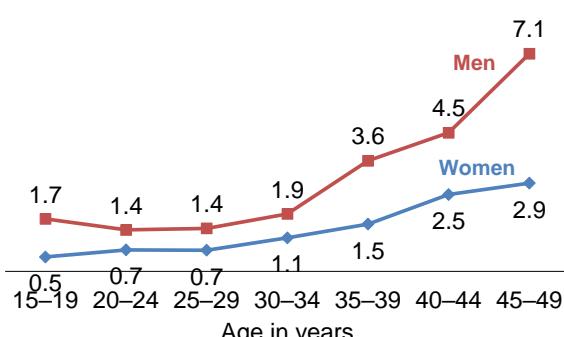

Table 18.3 presents age-specific direct estimates of maternal mortality from the reported survivorship of sisters for the 7-year period prior to the 2021–22 CDHS. These rates were calculated by dividing the number of maternal deaths by woman-years of exposure. To remove the effect of truncation bias (the lower boundary for eligibility among women interviewed in the survey is 15 years, and the upper boundary is 49 years), the overall rate for women age 15–49 was standardized by the age distribution of survey respondents.

- The rate of mortality associated with pregnancy and childbearing in Cambodia is 0.12 maternal deaths per 1,000 woman-years of exposure.
- The estimated age-specific mortality rate is highest among women age 35–39 (0.36).
- Maternal deaths represent 11% of all deaths among women age 15–49 during the 7-year period preceding the survey.
- The maternal mortality ratio for the 7-year period before the 2021–22 CDHS is estimated at 154 maternal deaths per 100,000 live births; that is, for every 1,000 births in Cambodia, an average of about 1.5 women die during pregnancy, during childbirth, or within 42 days of the end of a pregnancy from causes other than accidents or violence (**Table 18.4**). The confidence interval surrounding the maternal mortality ratio is 69–239.
- At current fertility and mortality rates, about 0.4% of women would be expected to die of maternal-related causes during their reproductive lifetime (i.e., a lifetime risk of 1 in 250).

18.5 TRENDS IN PREGNANCY-RELATED MORTALITY

Pregnancy-related mortality rate

The number of pregnancy-related deaths per 1,000 women age 15–49. Pregnancy-related mortality rates by 5-year age groups are calculated by dividing the number of pregnancy-related deaths to female siblings of respondents in each age group by the total person-years of exposure of the sisters to the risk of dying in that age group during the 7 years preceding the survey. The number of deaths is the number of sisters reported as having died in the 7 years preceding the survey during either pregnancy or delivery, or in the 2 months following the delivery or termination of a pregnancy, by their age group at the time of death. The person-years of exposure in each age group are calculated for both surviving and dead sisters based on their reported current age (living sisters) or age at death and years since death (dead sisters).

Sample: Sisters (both living and dead) age 15–49 in the 7 years preceding the survey, by 5-year age groups

Pregnancy-related mortality ratio

The number of pregnancy-related deaths per 100,000 live births. The pregnancy-related mortality ratio is calculated by dividing the age-standardized pregnancy-related mortality rate for women age 15–49 in the 7 years preceding the survey by the general fertility rate (GFR) for the same time period.

To allow comparisons with estimates from the 2005 CDHS and 2010 CDHS surveys, the 2021–22 CDHS defines a pregnancy-related death as the death of a woman during pregnancy or childbirth or within 2 months of the delivery or termination of a pregnancy, irrespective of the cause of death. Estimates of pregnancy-related mortality are therefore based solely on the timing of the death in relation to the pregnancy. Note that this definition varies from the WHO definition of a pregnancy-related death, which limits the window to 42 days and excludes deaths caused by accidents or incidental causes. What the

2021–22 CDHS defines as a pregnancy-related death had been labeled a maternal death in the 2000 CDHS and 2005 CDHS surveys. Estimates of pregnancy-related deaths from the 2010 CDHS and the 2014 CDHS are not comparable to those from the current survey.

The estimated pregnancy-related mortality ratio (PRMR) for the 7-year period preceding the 2021–22 CDHS is 163 deaths per 100,000 live births; that is, for every 1,000 births in Cambodia, about 1.6 women die during pregnancy or within 2 months of the end of a pregnancy from any cause including accidents and violence (**Table C.17**, in Appendix C). The confidence interval surrounding the pregnancy-related mortality ratio is 77–248.

Overall, there is a downward trend in the PRMR since 2000. According to the 2000 CDHS, the PRMR was 437 deaths per 100,000 live births (confidence interval: 325–549). According to the 2005 CDHS, the PRMR was 472 deaths per 100,000 live births (confidence interval: 338–605). The reference period between the 2000 CDHS and 2005 CDHS overlapped, and the confidence intervals overlap indicating there is no significant difference in the PRMR between these two surveys. However, the confidence intervals surrounding the 2000 CDHS and the 2005 CDHS estimates do not overlap with the 2021–22 CDHS PRMR, meaning that there is significant difference in the PRMR between the earlier surveys and the 2021–22 CDHS (**Figure 18.2**).

Note: Given that the estimates of maternal mortality in this survey are based on only 27 maternal deaths, the government of Cambodia wishes to consider more sensitive methods of estimating maternal mortality. Thus, future CDHS surveys may consider excluding this module.

LIST OF TABLES

For more information on adult and maternal mortality, see the following tables:

A.1 INTRODUCTION

The 2021–22 Cambodia Demographic and Health Survey (2021–22 CDHS) is the fifth of its kind following the ones conducted in 2000, 2005, 2010, and 2014. The 2021–22 CDHS incorporated a nationally representative sample of 21,270 households selected from 709 sample clusters. All women age 15–49 who were usual members of a sampled household or slept in the household the night before the survey were eligible for the survey. The survey was expected to result in about 22,400 completed interviews with women age 15–49. As with the previous surveys, the 2021–22 CDHS was designed to provide reliable information on fertility and childhood mortality, family planning, maternal and child health, knowledge and behavior regarding HIV/AIDS and other sexually transmitted infections (STIs), disability, child discipline, and domestic violence. It was also designed to collect information on basic living conditions of the household population such as use of electricity as the primary source of lighting, sources of improved drinking water, and use of improved sanitation facilities.

Apart from the female survey, a male survey was conducted at the same time in a subsample consisting of one out of two (50%) households selected for the female survey. All men age 15–49 who were usual members of a sampled household or slept in the household the night before the survey were eligible for individual male surveys. As with previous surveys, the male survey collected information on family planning and knowledge and behavior regarding HIV/AIDS and other sexually transmitted infections. Also, in this subsample, one eligible woman per household was selected randomly from all eligible women in the household to complete a domestic violence survey. In the other half (50%) of the households that were not selected for the male survey, all women age 15–49 and all children under age 5 had height and weight measurements taken to determine their nutritional status.

The survey was designed to provide representative results for all survey indicators for the country as a whole, for urban and rural areas separately, and for each of the 25 provinces.

A.2 SAMPLING FRAME

The sampling frame used for the 2021–22 CDHS was a list of all enumeration areas (EAs) created for the Cambodia General Population Census conducted in 2019 (2019 CGPC), which covered the entire country. The frame file was provided by the Cambodia National Institute of Statistics (NIS), which has 36,852 EAs completely covering the country. An EA is either a village or part of a large village; it is linked to information about its administrative affiliation and its locality, number of residential households, and type of residence (urban or rural). A cartographic map delimitating EA boundaries was also created at the time of the 2019 CGPC. Cambodia has 25 provinces, with each province subdivided into districts, each district subdivided into communes, and each commune subdivided into villages. **Table A.1** shows the distribution of households by province and by type of residence. In Cambodia, 37.5% of residential households are in urban areas and 62.5% are in rural areas. The largest province is Phnom Penh, accounting for 14.1% of the households in the country; the smallest province is Kep, which represents only 0.3% of households. **Table A.2** presents the distribution of EAs and their average size in terms of number of households by province and residence type. Among the 36,852 EAs, 12,893 are in urban areas and 23,959 are in rural areas. The average EA sizes (number of residential households) is 103 households in urban areas and 93 households in rural areas, with an overall average of 96 households per EA.

Table A.1 Households

Distribution of residential households by province and by type of residence, Cambodia DHS 2021–22

A.3 SAMPLING METHODOLOGY AND SAMPLING PROCEDURE

The sample for the 2021–22 CDHS was a stratified sample selected in two stages. Stratification was achieved by separating each province into urban and rural areas. As a result, the 25 provinces were stratified into 49 sampling strata in total because the capital city of Phnom Penh is completely urban. Samples were selected independently in every stratum via a two-stage random selection procedure, according to the sample allocation shown in **Table A.3**. Implicit stratification with proportional allocation was achieved at each of the lower-level administrative units by sorting the sampling frame before sample selection within each of the 49 sampling strata and by using a probability proportional to size selection procedure at the first stage of sampling.

Because of the large number of provinces and the relatively low fertility rate in most of the provinces, a power allocation with small adjustment was used to ensure comparable survey precision provinces. Phnom Penh was allocated a relatively larger sample size because of its low fertility rate and because it is the largest province in terms of population. The allocated sample size was then converted to number of households and number of EAs by taking nonresponse into account, by using the average number of eligible women age 15–49 per household, and by using a fixed sample take of 30 households in each urban and rural cluster. **Table A.3** shows the sample allocation in terms of number of clusters and number of households by province and by type of residence. In total, 709 EAs were selected, 241 from urban areas and 468 from rural areas. With a fixed sample take of 30 households per cluster, the total sample size was 21,270 households, 7,230 from urban areas and 14,040 from rural areas.

In the first stage, the 709 sample EAs were selected with probability proportional to EA size according to the sample allocation given in **Table A.3**. The EA size is the number of households residing in the EA. After the sample selection of EAs and before the main survey, a household listing operation was carried out in all of the selected EAs, and the resulting lists of households served as the sampling frame for the selection of households in the second stage. Some of the selected EAs were large in size. To reduce the task of household listing, selected EAs that had more than 200 households were segmented; only one segment was selected randomly to include in the survey, with a selection probability proportional to segment size. Household listing was conducted only in the selected segment. Thus, a 2021–22 CDHS cluster is either an EA or a segment of a large EA.

In the second selection stage, a fixed number of 30 households were selected from each cluster via equal probability systematic sampling. The sample households for the 2021–22 CDHS were preselected in the central office before the main survey. During the main survey, the interviewers were asked to interview only the preselected households; to prevent bias, no replacement was allowed for unfound or nonresponding households. All women age 15–49 in the selected households were eligible for the female individual survey, and all men age 15–49 in the households selected for the male survey were eligible for the male individual survey.

Table A.4 shows the expected number of interviews with women and men by province and by type of residence. The expected numbers of completed interviews with women were 8,807 and 14,076 for urban and rural areas, respectively, with a total of 22,883 interviews. For the male survey, conducted in one in every two households selected for the female survey, the expected numbers of completed interviews with men were 3,690 and 5,951 for urban and rural areas, respectively, with the total of 9,641 interviews.

Cambodia	8,807	14,076	22,883	3,690	5,951	9,641

Note: The male survey was conducted in 50% of the households selected for the female survey.

The number of expected interviews were calculated based on facts obtained from the 2014 CDHS: there were an average of 1.30 and 1.06 women age 15–49 in each urban and rural household, respectively, with small variations across provinces; the household gross response rate was 96.8% for both urban and rural areas; the individual response rate for women was 97.6% in both urban and rural areas; there were on average 1.13 and 0.93 men age 15–49 in each urban and rural household, respectively, with small

variations across provinces; and the individual response rate for men was 94.6% in both urban and rural areas.

A.4 SAMPLING PROBABILITIES

Due to the nonproportional allocation of the sample to the different provinces and to their urban and rural areas, along with possible differences in response rates, sampling weights are required for any analysis using the 2021–22 CDHS data to ensure the actual representativeness of the survey results at national level and as well as the provincial level. Since the 2021–22 CDHS sample was a two-stage stratified cluster sample, sampling weights were calculated based on sampling probabilities separately for each sampling stage and for each cluster. The following notations were used:

P_{1hi} : first-stage sampling probability of the i^{th} cluster in stratum h

P_{2hi} : second-stage sampling probability within the i^{th} cluster (household selection)

Let n_h be the number of clusters selected in stratum h , M_{hi} the number of households according to the sampling frame in the i^{th} cluster, and $\sum M_{hi}$ the total number of households in the stratum. The probability of selecting the i^{th} cluster in the 2021–22 CDHS sample is calculated as follows:

$$\frac{n_h M_{hi}}{\sum M_{hi}}$$

Let s_{hi} be the proportion of households in the selected segment relative to the total number of households in EA i in stratum h if the EA is segmented; otherwise, $s_{hi} = 1$. Then the probability of selecting cluster i in stratum h in the sample is:

$$P_{Ihi} = \frac{n_h M_{hi}}{\sum M_{hi}} \times s_{hi}$$

Let L_{hi} be the number of households listed in the household listing operation in cluster i in stratum h , and let m_{hi} be the number of households selected in the cluster. The second stage's selection probability for each household in the cluster is calculated as follows:

$$P_{2hi} = \frac{m_{hi}}{L_{hi}}$$

The overall selection probability of each household in cluster i of stratum h is therefore the product of the two-stage selection probabilities:

$$P_{hi} = P_{1hi} \times P_{2hi}$$

The sampling weight for each household in cluster i of stratum h is the inverse of its overall selection probability:

$$W_{hi} = 1 / P_{hi}$$

Sampling weights were adjusted for household nonresponse as well as for individual nonresponse to calculate the survey weights. A spreadsheet containing all sampling parameters and selection probabilities was prepared to facilitate the calculation of survey weights. Several sets of survey weights were calculated:

- one set for all households and for the women's individual survey
- one set for households selected for the male survey and for the male individual survey
- one set for women selected for the domestic violence survey

The differences between the household weights and the individual weights are introduced by individual nonresponse. The domestic violence weight takes the number of eligible women in the household into account because of the selection of only one woman per household. The final survey weights were normalized so that the total number of unweighted cases was equal to the total number of weighted cases at the national level. The normalized weights are relative weights which are valid for estimating means, proportions, and ratios, but not valid for estimating population totals and for pooled data.

Sampling errors were calculated for selected indicators for the national sample, for urban and rural areas separately, and for each of the 25 provinces.

¹ Using the number of households falling into specific response categories, the household response rate (HRR) is calculated as:

$$\frac{100 * C}{C + HP + P + R + DNF}$$

² The eligible men response rate (EMRR) is equivalent to the percentage of interviews completed (EMC).

³ The overall men response rate (OMRR) is calculated as:

$$OMRR = HRR * EMRR / 100$$

The estimates from a sample survey are affected by two types of errors: (1) nonsampling errors and (2) sampling errors. Nonsampling errors are errors that were made during data collection and data processing such as failure to locate and interview the correct household, misunderstanding of the questions by either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the 2021–22 Cambodia Demographic and Health Survey (CDHS) to minimize this type of error, nonsampling errors are impossible to eliminate completely and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in the 2021–22 CDHS is only one of many possible samples that could have been selected from the same population, using exactly the same design. Each of those samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability between all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the *standard error* for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95% of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the 2021–22 CDHS sample was the result of a multistage stratified design, and, consequently, it was necessary to use more complex formulas. The computer software used to calculate sampling errors for the 2021–22 CDHS was an SAS program. This program used the Taylor linearization method for estimate variances for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as fertility and mortality rates.

The Taylor linearization method treats any percentage or average as a ratio estimate, $r = y/x$, where y represents the total sample value for variable y and x represents the total number of cases in the group or subgroup under consideration. The variance of r is computed using the formula given below, with the standard error being the square root of the variance:

$$SE^2(r) = var(r) = \frac{1}{x^2} \sum_{h=1}^H \left[(1-f_h) \frac{m_h}{m_h - 1} \left(\sum_{i=1}^{m_h} z_{hi}^2 - \frac{z_h^2}{m_h} \right) \right]$$

in which

$$z_{hi} = y_{hi} - rx_{hi} \text{ and } z_h = y_h - rx_h$$

where h represents the stratum, which varies from 1 to H ;
 m_h is the total number of clusters selected in the h^{th} stratum;
 y_{hi} is the sum of the weighted values of variable y in the i^{th} cluster in the h^{th} stratum;
 x_{hi} is the sum of the weighted number of cases in the i^{th} cluster in the h^{th} stratum; and
 f_h is the sampling fraction of PSU in the h^{th} stratum.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample and calculates standard errors for these estimates using simple formulas. Each replication considers *all but one* cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the 2021–22 CDHS, there were 709 non-empty clusters. Hence, 709 replications were created. The variance of a rate r is calculated as follows:

$$SE^2(r) = var(r) = \frac{1}{k(k-1)} \sum_{i=1}^k (r_i - r)^2$$

in which

$$r_i = kr - (k-1)r_{(i)}$$

where r is the estimate computed from the full sample of 709 clusters, $r_{(i)}$ is the estimate computed from the reduced sample of 708 clusters (i^{th} cluster excluded), and k is the total number of clusters.

In addition to the standard error, the program computes the design effect (DEFT) for each estimate, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design, such as multistage or cluster selection. The program also computes the relative standard error and the confidence limits for the estimates.

Sampling errors for the 2021–22 CDHS are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for the country as a whole, for urban and rural areas separately, and for each of the 25 provinces. For each variable, the type of statistic (mean, proportion, or rate) and the base population are given in Table B.1. Tables B.2 to B.29 present the value of the statistic (R), its standard error (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95% confidence limits ($R \pm 2SE$) for each variable. The DEFT is considered undefined when the standard error considering a simple random sample is zero (when the estimate is close to 0 or 1). In the case of the total fertility rate, the number of unweighted cases is not relevant, as there is no known unweighted value for woman-years of exposure to childbearing.

The confidence interval (e.g., as calculated for *mean number of children ever born to women age 15–49*) can be interpreted as follows: the overall average from the national sample is 1.684 and its standard error is 0.016. Therefore, to obtain the 95% confidence limits, one adds and subtracts twice the standard error to the sample estimate, that is, $1.684 \pm 2 \times 0.016$. There is a high probability (95%) that the true mean number of children ever born to women age 15–49 is between 1.652 and 1.716.

For the total sample, the value of the design effect (DEFT), averaged over all variables for the women's survey, is 1.5. This means that, due to multistage clustering of the sample, the average standard error is increased by a factor of 1.5 over that in an equivalent simple random sample.

Table B.1 List of selected variables for sampling errors, Cambodia DHS 2021–22

Variable	Estimate	Base population
HOUSEHOLDS AND POPULATION		
Electricity primary source of lighting	Proportion	De jure household population
Primary reliance on clean fuels and technology for cooking	Proportion	De jure household population
Births registered with civil authority	Proportion	De jure household population under 5
Improved drinking water source	Proportion	De jure household population
At least basic drinking water service	Proportion	De jure household population
Water available when needed	Proportion	De jure household population
Improved sanitation facility	Proportion	De jure household population
At least basic sanitation service	Proportion	De jure household population
Using open defecation	Proportion	De jure household population
Using a handwashing facility with soap and water	Proportion	De jure household population for whom handwashing place was observed or with no on-site place for handwashing
WOMEN		
Urban residence	Proportion	Women 15–49
No education	Proportion	Women 15–49
Secondary education or higher	Proportion	Women 15–49
Literacy	Proportion	Women 15–49
Use of the internet in last 12 months	Proportion	Women 15–49
Current tobacco use	Proportion	Women 15–49
Currently married/in union	Proportion	Women 15–49
Married before age 15	Proportion	Women 20–49
Married before age 18	Proportion	Women 20–49
Had sexual intercourse before age 18	Proportion	Women 20–49
Age-specific fertility rate (15–19)	Rate	Woman-years of exposure to childbearing at age 15–19 in the 3 years preceding the survey
Total fertility rate (3 years)	Rate	Woman-years of exposure to childbearing
Currently pregnant	Proportion	Women 15–49
Mean number of children ever born to women age 40–49	Mean	Women 40–49
Mean number of children ever born to women age 15–49	Mean	Women 15–49
Mean number of living children born to women age 15–49	Mean	Women 15–49
Median birth interval	Median	Non-first births in the 5 years preceding the survey
Mean age at menarche	Mean	Women 15–49
First birth before age 18	Proportion	Women 20–49
Want to delay next birth at least 2 years	Proportion	Currently married women 15–49
Want no more children	Proportion	Currently married women 15–49
Ideal number of children	Mean	Women 15–49 with numeric responses
Total wanted fertility rate (3 years)	Rate	Woman-years of exposure to childbearing
Currently using any contraceptive method	Proportion	Currently married women 15–49
Currently using any modern method	Proportion	Currently married women 15–49
Currently using pill	Proportion	Currently married women 15–49
Currently using injectables	Proportion	Currently married women 15–49
Currently using implants	Proportion	Currently married women 15–49
Currently using male condoms	Proportion	Currently married women 15–49
Currently using any traditional method	Proportion	Currently married women 15–49
12-month discontinuation rate due to method failure	Rate	Women 15–49
12-month discontinuation rate due to any reason	Rate	Women 15–49
12-month discontinuation rate due to switching to another method	Rate	Women 15–49
Unmet need for spacing	Proportion	Currently married women 15–49
Unmet need for limiting	Proportion	Currently married women 15–49
Unmet need total	Proportion	Currently married women 15–49
Demand satisfied by modern methods	Proportion	Currently married women 15–49
Participation in decision making about family planning	Proportion	Currently married women 15–49
Not exposed to any of the eight media sources	Proportion	Currently married women 15–49
Neonatal mortality rate ¹	Rate	Children exposed to the risk of mortality
Postneonatal mortality rate ¹	Rate	Children exposed to the risk of mortality
Infant mortality rate ¹	Rate	Children exposed to the risk of mortality
Child mortality rate ¹	Rate	Children exposed to the risk of mortality
Under-5 mortality rate ¹	Rate	Children exposed to the risk of mortality
Perinatal mortality rate	Rate	Pregnancies of 7 or more months' duration to women 15–49 in the 5 years preceding the survey
Stillbirth rate	Rate	Pregnancies of 7 or more months' duration to women 15–49 in the 5 years preceding the survey
Early neonatal rate	Rate	Pregnancies of 7 or more months' duration to women 15–49 in the 5 years preceding the survey
In any avoidable high-risk category	Proportion	Children born in the 5 years preceding the survey to women 15–49 in the 5 years preceding the survey
Received ANC from a skilled provider	Proportion	Women 15–49 who had a live birth in the 2 years preceding the survey
4+ ANC visits	Proportion	Women 15–49 who had a live birth in the 2 years preceding the survey
8+ ANC visits	Proportion	Women 15–49 who had a live birth in the 2 years preceding the survey
Took any iron-containing supplements	Proportion	Women 15–49 who had a live birth in the 2 years preceding the survey
Mothers protected against tetanus for last birth	Proportion	Women 15–49 with a live birth in the 2 years preceding the survey

Continued...

Table B.1—Continued

Variable	Estimate	Base population
Delivered in a health facility	Proportion	Live births in the 2 years preceding the survey
Delivered by a skilled provider	Proportion	Live births in the 2 years preceding the survey
Delivered by C-section	Proportion	Live births in the 2 years preceding the survey
Women with postnatal check during first 2 days	Proportion	Women 15–49 with a live birth in the 2 years preceding the survey
Newborns with postnatal check during first 2 days	Proportion	Most recent live births in the 2 years preceding the survey
Any problem accessing health care	Proportion	Women 15–49
Ever had vaccination card	Proportion	Children 12–23 months
Received BCG vaccination	Proportion	Children 12–23 months
Received DPT-HepB-Hib vaccination (3 doses)	Proportion	Children 12–23 months
Received pneumococcal vaccination (3 doses)	Proportion	Children 12–23 months
Received MCV (12–23 months)	Proportion	Children 12–23 months
Fully vaccinated according to national schedule (12–23 months)	Proportion	Children 12–23 months
Received MCV (24–35 months)	Proportion	Children 24–35 months
Fully vaccinated according to national schedule (24–35 months)	Proportion	Children 24–35 months
Sought medical treatment for diarrhea	Proportion	Children under 5 with diarrhea in last 2 weeks
Treated with ORS	Proportion	Children under 5 with diarrhea in last 2 weeks
Height-for-age (-3 SD)	Proportion	Children under 5 who were measured
Height-for-age (-2 SD)	Proportion	Children under 5 who were measured
Weight-for-height (-2 SD)	Proportion	Children under 5 who were measured
Weight-for-height (+2 SD)	Proportion	Children under 5 who were measured
Weight-for-age (-2 SD)	Proportion	Children under 5 who were measured
Exclusive breastfeeding	Proportion	Youngest children 0–5 months living with their mother
Minimum dietary diversity (children 6–23 months)	Proportion	Youngest children 6–23 months living with their mother
Body mass index (BMI) <18.5	Proportion	Women 20–49 who were measured
Body mass index (BMI) ≥25.0	Proportion	Women 20–49 who were measured
Minimum dietary diversity (women 15–49)	Proportion	Women 15–49
Child had fever in last 2 weeks	Proportion	Child under 5
Condom use at last sex	Proportion	Women 15–49 with nonmarital, noncohabiting partner in last 12 months
Ever tested for HIV and received results of last test	Proportion	Women 15–49
Employed in last 12 months	Proportion	Currently married women 15–49
Employed in last 12 months but not paid	Proportion	Currently married women 15–49 employed in last 12 months
Mobile phone ownership	Proportion	Women 15–49
Have and use a bank account or mobile phone for financial transactions	Proportion	Women 15–49
Participate in decision making (all three decisions)	Proportion	Currently married women 15–49
Agree with at least one specified reason a husband is justified in wife beating	Proportion	Women 15–49
Make own decisions about sexual relations, contraceptive use, and reproductive care	Proportion	Currently married women 15–49
Experienced physical violence since age 15 by any perpetrator	Proportion	All women 15–49
Experienced sexual violence by any perpetrator ever	Proportion	All women 15–49
Experienced sexual violence by any non-intimate partner	Proportion	All women 15–50
Experienced physical/sexual violence by the current or most recent husband or intimate partner ever	Proportion	Ever-married women 15–49
Experienced emotional/physical/sexual violence by any husband or intimate partner ever	Proportion	Ever-married women 15–49
Experienced emotional/physical/sexual violence by any husband or intimate partner in the past 12 months	Proportion	Ever-married women 15–49
MEN		
Urban residence	Proportion	Men 15–49
No education	Proportion	Men 15–49
Secondary education or higher	Proportion	Men 15–49
Literacy	Proportion	Men 15–49
Use of the internet in last 12 months	Proportion	Men 15–49
Current tobacco use	Proportion	Men 15–49
Currently married/in union	Proportion	Men 15–49
Had sexual intercourse before age 18	Proportion	Men 20–49
Want no more children	Proportion	Currently married men 15–49
Want to delay next birth at least 2 years	Proportion	Currently married men 15–49
Ideal number of children	Mean	Men 15–49 with numeric responses
Discriminatory attitudes towards people with HIV	Proportion	Men 15–49 who have heard of HIV/AIDS
Condom use at last sex	Proportion	Men 15–49 with nonmarital, noncohabiting partner in last 12 months
Ever tested for HIV and received results of last test	Proportion	Men 15–49
Male circumcision	Proportion	Men 15–49
Mobile phone ownership	Proportion	Men 15–49
Have and use a bank account or mobile phone for financial transactions	Proportion	Men 15–49
Agree with at least one specified reason a husband is justified in wife beating	Proportion	Men 15–49

¹ Mortality rates are calculated for the 5 years before the survey for the national, urban, and rural samples and for the 10 years before the survey for the provincial samples.

Table C.11 Heaping in anthropometric measurements for children (digit preference)

Distribution of weight and height/length measurements by decimal digit recorded (unweighted), Cambodia DHS 2021–22

Digit	Weight		Height or length	
	Number	Percent	Number	Percent
0	594	13.6	1,358	31.2
1	422	9.6	384	8.8
2	466	10.6	437	10.1
3	439	10.0	321	7.4
4	371	8.5	275	6.3
5	582	13.3	671	15.4
6	388	8.9	301	6.9
7	369	8.4	235	5.4
8	372	8.5	194	4.5
9	378	8.6	172	4.0
Total	4,381	100.0	4,348	100.0
Index of dissimilarity ¹	na	7.5	na	26.7

Note: Table includes all children with weight and height/length measurements, regardless of the completeness of date of birth information and cases with implausible data. Both weight and length/height measurements were recorded with one decimal digit.

na = not applicable

¹ The index of dissimilarity is a measure of digit preference calculated as one-half of the sum of absolute differences between the observed and the expected percentage. It can be interpreted as the percentage of values that would need to be redistributed in order to achieve a uniform distribution.

Table C.12 Observation of handwashing facility

Percent distribution of handwashing facilities in all households by whether or not they were observed by the interviewers, according to background characteristics (weighted), Cambodia DHS 2021–22

Note: Age at the beginning of the school year is calculated from dates of birth of household members or by rejuvenating household members based on the date of the survey, the date after the start of the school year, and completed age at the time of survey. Levels and grades refer to the current school year or the most recent school year if data collection was completed between school years. Those age 25 at the time of the interview who were age 24 at the beginning of the school year are excluded from the table since data on current attendance were collected only for those age 4–24 at the time of the interview.

Table C.14 Vaccination cards photographed

Percentage of children under age 3 reported to have a vaccination card, percentage whose vaccination card was seen by the interviewer, percentage whose vaccination card was photographed or was not photographed by reason, and among children with a vaccination card seen, percentage of cards photographed, according to background characteristics (weighted), Cambodia DHS 2021–22

Background characteristic	Percentage of children reported to have a vaccination card	Percentage of children whose vaccination card was seen by interviewer	Percentage of children whose vaccination card was photographed	Percentage of children whose vaccination card was not photographed as permission was not received	Percentage of children whose vaccination card was not photographed for other reasons	Number of children	Among children with a vaccination card seen	
							Percentage of vaccination cards photographed	Number of children

Note: EAs are classified by month according to the date by which the last Biomarker Questionnaire in the EA was completed.

Table C.16 Sibship size and sex ratio of siblings

Mean sibship size and sex ratio of siblings at birth, Cambodia DHS 2021–22

Age of respondent	Mean sibship size ¹	Sex ratio of siblings at birth ²
15–19	3.6	112.6
20–24	4.3	111.1
25–29	4.7	102.9
30–34	5.2	104.5
35–39	5.5	104.9
40–44	5.7	104.7
45–49	5.8	101.3
Total	4.9	105.6

¹ Includes the respondent

² Excludes the respondent

Table C.17 Pregnancy-related mortality trends

Direct estimates of pregnancy-related mortality rates for the 7 years preceding each survey, by 5-year age groups, Cambodia DHS 2021–22

Age	Pregnancy-related mortality rate ^{1,2}		
	2015–2022	1998–2005	1993–2000
15–19	0.00	0.13	0.12
20–24	0.09	0.27	0.41
25–29	0.04	0.48	0.86
30–34	0.23	0.94	0.80
35–39	0.36	0.81	1.18
40–44	0.00	0.81	0.43
45–49	0.15	0.38	0.24
Total 15–49 ^a	0.13	0.50	0.55
Total fertility rate (TFR)	2.7	3.4	3.4
General fertility rate (GFR) ³	81	111	127
Pregnancy-related mortality ratio (PRMR) ⁴	163	472	437
Confidence interval	77–248	338–605	325–549
Lifetime risk of pregnancy-related death ⁵	0.004	0.016	0.020

¹ Pregnancy-related mortality is defined as the death of a woman while pregnant or within 2 months of termination of pregnancy from any cause including accidents or violence.

² Expressed per 1,000 woman-years of exposure

³ Age-adjusted rate expressed per 1,000 women age 15–49

⁴ Expressed per 100,000 live births; calculated as the age-adjusted pregnancy-related mortality rate times 100 divided by the age-adjusted general fertility rate

⁵ Calculated as $1 - (1 - \text{PRMR})^{\text{TFR}}$, where TFR represents the total fertility rate for the 7 years preceding the survey

^a Age-adjusted rate

Table C.18 Pregnancy-related mortality

Direct estimates of pregnancy-related mortality rates for the 7 years preceding the survey, by 5-year age groups, Cambodia DHS 2021–22

Age	Percentage of female deaths that are pregnancy-related	Pregnancy-related deaths ¹	Exposure years	Pregnancy-related mortality rate ²

INTRODUCTION AND CONSENT

Hello. My name is _____. I am working with the National Institute of Statistics. We are conducting a survey about health and other topics all over Cambodia. The information we collect will help the government to plan health services. Your household was selected for the survey. I would like to ask you some questions about your household. The questions usually take about 15 to 20 minutes. All of the answers you give will be confidential and will not be shared with anyone other than members of our survey team. You don't have to be in the survey, but we hope you will agree to answer the questions since your views are important. If I ask you any question you don't want to answer, just let me know and I will go on to the next question or you can stop the interview at any time. In case you need more information about the survey, you may contact the person listed on this card.

GIVE CARD WITH CONTACT INFORMATION

Do you have any questions?
May I begin the interview now?

INTRODUCTION AND CONSENT

Hello. My name is _____. I am working with the Ministry of Planning/the Ministry of Health. We are conducting a survey about health and other topics all over Cambodia. The information we collect will help the government to plan health services. Your household was selected for the survey. The questions usually take about 30 to 60 minutes. All of the answers you give will be confidential and will not be shared with anyone other than members of our survey team. You don't have to be in the survey, but we hope you will agree to answer the questions since your views are important. If I ask you any question you don't want to answer, just let me know and I will go on to the next question or you can stop the interview at any time.

In case you need more information about the survey, you may contact the person listed on the card that has already been given to your household.

Do you have any questions?
May I begin the interview now?

INTRODUCTION AND CONSENT

Hello. My name is _____. I am working with the Ministry of Health and Ministry of Planning. We are conducting a survey about health and other topics all over Cambodia. The information we collect will help the government to plan health services. Your household was selected for the survey. The questions usually take about 20 minutes. All of the answers you give will be confidential and will not be shared with anyone other than members of our survey team. You don't have to be in the survey, but we hope you will agree to answer the questions since your views are important. If I ask you any question you don't want to answer, just let me know and I will go on to the next question or you can stop the interview at any time.

In case you need more information about the survey, you may contact the person listed on the card that has already been given to your household.

Do you have any questions?

May I begin the interview now?
